The accounts show a profit for the year of £8,144. In their report the directors state that the position of the company has improved. The competition for business has continued most keenly, and the margins of profits have correspondingly suffered, although aggregate tonnage delivered has again increased. The directors do not write off anything for depreciation of plant and machinery, as the same has been fully maintained out of revenue. Desilverising machinery has been discontinued at the Bagillt works by reason of heavy dues and transport charges, which, added to the scarcity of silver lead, render it impossible for the company at present to carry on this department of business there, except at a loss. Arrangements have been made with reference to the Old Shot Wharf, hitherto controlled by the company, and carried on by the name of Lane, Sons, and Co., Ltd., by which a further annual profit will be effected. A further sum of £2,000. has been paid in reduction of the liability *re* E. J. Walker, and charged to profit and loss account, less the proceeds realised by the sale of certain ordinary shares. There remains, therefore, but £1,000. still payable under this head. On the retirement of the members of the old board, at the last meeting, the new directors found themselves confronted with difficulties, which have, happily, been overcome. The company is now absolutely free from litigation and complication of whatever kind, and the directors, while regretting their inability to declare a dividend, are of opinion that the outlook for the current year is very favourable.

### PRICE'S PATENT CANDLE CO., LTD.

The report of the directors of this company for the past year shows that a disruption in January of the working agreement between allied producers of paraffin was followed immediately by a dissolution of the Candle-makers' Association, and a consequent revival of competition for business which had injuriously affected both producers and candle-makers in the two preceding years. The

pany's profit for 1895 amounted to £82,858., as compared with £69,594. in 1894. Adding to the profit of 1895 the £8,842. brought forward from 1894, together £91,701., there remained at the close of the year, and after deducting the dividend of 15s. per share paid in September, a disposable sum of £63,576. The directors recommend that £12,500. be, as usual, written off for depreciation of fixed properties and plans, that £32,812. be applied in paying, on the 14th inst., a dividend of 17s. 6d. per share, making, with the dividend of 15s. per share paid in September last, a dividend of £1. 12s. 6d. per £16. share for 1895, as against £1. 7s. 6d. for 1894, and £1. 5s. for 1893, the adding of £10,000. to the reserve fund, which will thus be raised to £25,000., and the carrying forward to 1896 of £8,264. The time has arrived when increased accommodation has become necessary for meeting the requirements in London of the company's steadily-growing business. The yards where the stocks of materials are stored at Battersea have been encroached upon of late years by the extension of the factory buildings, whilst the paraffin stocks have gradually increased with the growth of business. Under these circumstances additional stock room has become essential, alike for manufacturing requirements and for affording space for removals should an outbreak of fire unhappily occur; and if the growth of the business continues a small auxiliary factory will be needed at no distant date for carrying on work in departments now employed to almost their utmost capacity for production. As no land suitable for these purposes was available on the Surrey side of the Thames, the directors have bought eight acres of vacant land on the Middlesex shore at Fulham, immediately opposite to the Battersea factory; but before this land can be utilised for its destined purpose, it must be embanked to the satisfaction of the Thames Conservators along its river frontage. The total cost of the purchase and embankment, and of contributing towards the expense of making an inland road and sewer now being constructed by local authorities, is estimated at £23,500., which will be paid out of existing capital.

## SOCIETY OF CHEMICAL INDUSTRY.

### SCOTTISH SECTION.

A MEETING of this Section was held in Glasgow, on Tuesday the 3rd inst., in the rooms of the Society, 207, Bath-street, Dr. John Clark presided. The announced subject for the evening was "The Standard of Flash Point for Mineral Oil" by Mr. D. R. Steuart, of the Broxburn Oil Company. The interest centering in this matter is greater than in any for some time before the Section, and the attendance showed an improvement even in spite of the unpropitious weather. Mr. Steuart is amongst the foremost calling for flash point reform, and he had nothing specially new to advance; but the freshness and earnestness of his treatment undoubtedly gave a renewed stimulus to the agitation, which will no doubt be added to on the resumption of the discussion at the next meeting of the Section. The lecturer referred at some length to the exhaustive series of experiments made by him, upon the Abel test, a matter formerly dealt with in papers of his which are already in the records of the Society. The points which he now emphasised were, that even when not over Abel standard of 73 degs. there was danger (with some sorts of oil) of severe lamp explosion, and that at a very few degrees above that the explosion had been found to be very severe; with oil of 73 degs. serious danger begins at 78 degs. in the case of oil spilled by lamps upsetting, while with oil of 100 degs. danger in like case does not begin till there is a temperature of from 110 to 115 degs.; before the introduction of American petroleum into this country when only the native paraffin oil was burned, there was little heard of lamp accidents, whereas reports of these have since become numerous; cheap lamps of glass and of random construction were to be avoided certainly, but the essential was the change of the flash point standard for which they were contending, since oils of 73 to 83 degs. flash point gave off explosive vapours at summer temperatures, and in winter also at ordinary lamp temperature. If a lamp consuming oil of 100 degs. flash were upset it was a thousand to one that the light would become extinguished without doing harm. He would have the flash point fixed so high that practically it would never be touched in the case of lamps kept in passable order, but there was a powerful conspiracy in London to keep things as they now stand at every cost, and it was that influential conspiracy that they had to break down. The flash of oil for popular use should be so high that filling the lamp when burning, carrying about, or extinguishing by blowing or turning down the wick, could be done with perfect safety. If vapours were not evolved there could be no explosion, and vapours could not be evolved at all unless the oil became heated above the flash point. Therefore, the standard should be so high that under ordinary circumstances it would never be reached in the lamp of the people. Subject to this paramount condition the standard should be as low as possible. A discussion followed, and was adjourned to next meeting in April.

## Parliamentary Notes.

### THE FERTILISERS AND FEEDING STUFFS ACT.

In the House of Commons, last week, Mr. Herbert Lewis asked the President of the Board of Agriculture whether it had been brought to his notice that up to a recent date the number of samples analysed under the Fertilisers and Feeding Stuffs Act, 1893, exceeded ten in six counties only; that in each of eight counties only one analysis had been made; and that in ten counties there had been no analysis at all; and whether, in view of the complexity of the Board of Trade regulations prescribing the procedure for the taking of samples, and for other matters under the Act, the regulations would be simplified, with a view to preventing agriculturists from being deprived of the advantages which the Act confers.

Mr. Long replied that during the two years in which the Fertilisers and Feeding Stuffs Act, 1893, had been in operation the number of samples analysed in Great Britain had exceeded 10 in 27 counties, whilst in nine counties only one analysis had been made, and in 29 counties there had been no analysis. He should be glad to receive and consider any suggestions for the simplification of the regulations under which analyses are taken, but it should be remembered that the analysis might become the basis not only of civil but of criminal proceedings, and it was therefore essential that no mistake should be made in regard to the sample, and that it should accurately represent the article supplied.

### THE SETTLEMENT OF TRADE DISPUTES.

A Bill "to make better provision for the settlement of trade disputes," brought in by Mr. Ritchie, Sir Matthew White Ridley, and Mr. Chamberlain, has been published. It provides for the registration of boards of conciliation, and gives power to the Board of Trade, where a dispute exists or is apprehended, to inquire and report on the circumstances, to take steps for enabling the parties to meet under the presidency of a chairman mutually agreed upon or nominated by the Board of Trade or otherwise, to appoint a conciliator or conciliation board on the application of employers or workmen, or to appoint an arbitrator on the application of both parties. The Bill also provides that the Board of Trade shall have power to aid in the establishment of conciliation boards in districts where adequate means of conciliation do not appear to exist.

### TRACTION ENGINE REGULATIONS.

In the House of Commons, on Tuesday, on the motion of Mr. G. Boscawen, a Select Committee was appointed to inquire into the working of the laws relating to the use of traction engines on roads.

### THE PETROLEUM INQUIRY.

On the motion of Sir W. Walrond, a Select Committee was appointed to inquire into and report upon the sufficiency of the law relating to the keeping, selling, using, and conveying of petroleum and other inflammable liquids, and the precautions to be adopted for the prevention of accidents with petroleum lamps.

## Trade Notes.

**NITRATE STATISTICS.**—The Public Statistical Circular of the Permanent Nitrate Committee states:—"Nitrate of soda—Total exports to Europe, February, 1,414,000 quintals; loading for Europe, March 1, 1,823,000 quintals; imports, Europe, February, 121,950 tons; deliveries in Europe, February, 190,280 tons; visible supply, Europe, March 1—stocks and afloat, 540,020 tons."

**THE CYANIDE PROCESS.**—The action brought by Mr. James Hay against the African Gold Recovery Company to decide whether the patent rights of the company in the MacArthur-Forrest gold extraction process, commonly known as the cyanide process, are valid in South Africa, was to come before the court at Pretoria on the 17th inst. Mr. Erselen (ex-State Attorney), who has been retained for the company, is at present studying the process at the works.

**THE MANCHESTER PLATE GLASS COMPANY, LIMITED.**—We learn that the Plate Glass Works, with fixed machinery and plant, and the adjacent properties of the London and Manchester Plate Glass Company, Limited (in liquidation), situate at Sutton, St. Helens, Lancashire, the whole extending to about 200 acres, will be offered for sale by public auction, in one lot, in or about the month of April next. The works are capable of turning out 65,000 square feet of polished plate glass per week, by using in combination part of the old machinery, and the whole of the new and modern machinery recently introduced, or, 45,000 square feet per week, by using the new and modern machinery alone.

**BORAX PRODUCTION IN THE STATES.**—The following table shows the output of borax in pounds, for the last five years.

| Year.     | California. | Nevada.   | Total.     | Value.    |
|-----------|-------------|-----------|------------|-----------|
| 1891..... | 8,533,337   | 3,296,663 | 11,830,000 | \$887,250 |
| 1892..... | 11,050,495  | 1,487,701 | 12,538,196 | 940,365   |
| 1893..... | 7,999,562   | 1,199,438 | 9,199,000  | 689,925   |
| 1894..... | 11,540,999  | 1,600,498 | 13,140,594 | 919,842   |
| 1895..... | 11,869,173  | 1,587,215 | 13,456,388 | 739,386   |

**CUBAN SUGAR INDUSTRY.**—The Cuban Sugar Industry is reported as being completely demoralised. There are only sixteen of 366 estates in Cuba now grinding cane. The outlook is gloomy in the extreme. The sugar output of Cuba this year to February 27th is under 26,000 tons, as against 276,000 tons for the same period last year. The total crop this season will probably amount to 150,000 tons, as against 1,070,000 tons last year. America, which consumes nearly all the Cuban sugar, will thus look to Europe to supply the deficiency of, roughly, 900,000 tons.

## Market Reports.

### TAR AND AMMONIA PRODUCTS.

Benzols are quietly steady at 2s. for 90's and 1s. 8d. for 50/90's. Carbolic acids continue very firm, with crude (60%) at 2s. 3d. Crystals (40%) are in good demand at 8½d. Crude naphtha is slightly easier, the quotation now being 9d. Solvent is unchanged at 1s 6d. Creosote easy and lower. Anthracene unaltered. Pitch quiet at 34s., f.o.b. East Coast.

Sulphate of ammonia is rather firmer, but the demand is somewhat feeble. A small business has been doing at about the figures given below, but buyers are not keen and decline to pay an advance. Beckton is quoted £8. 7s. 6d., London outside makes £8. 10s., Liverpool £8. 8s. 9d. to £8. 10s., Hull £8. 8s. 9d., and Leith £8. 7s. 6d., all prompt. Nitrate of soda steady.

### LIVERPOOL MINERAL MARKET.

The firm tone reported in our market last week has been well maintained; some minerals have advanced, with the probability of a still further upward tendency. Manganese arrivals are very slow, whilst stocks are practically exhausted; prices therefore have advanced. Ground manganese: The demand is brisk at £7., £9., £11., and £13. 10s. per ton, according to quality. Sulphate of manganese: High quality is selling freely at good figures. Manganiferous ore is in good demand at advanced figures. Chrome ore: Arrivals have improved; prices are steady. Bauxite: The demand is good; aluminium metal works have now started, and the consumption is, therefore, greatly increased, and a large trade is expected at high figures; present prices are 20s. for first, 16s. for second, and 16s. for third quality, f.o.b. French chalk: Although arrivals have increased they can scarcely keep pace with the demand, whilst stocks are very low; prices are therefore strong at 70s. to 75s., 80s. to 90s., and 100s. to 110s. per ton for "Angel White" brands, according to grade. Wolfram and scheelite: There is more doing at improved prices; stocks are small. Arsenic continues strong at £20 per ton. Fuller's earth: The demand continues steady at unaltered prices—50s. for lump, 55s. for ground, and 75s. for impalpable powder, "Emerald," and other brands. Rottenstone: Prime qualities are in fair request at full prices—£8. 10s. to £14. per ton, according to grade. Ochres and umbers continue in good demand, especially for good staining qualities, prime J.C. ochre being done at 60s per ton, and umber 40s. to 45s. per ton. Carbonate and sulphate of barytes: The demand is fair, with an upward tendency. Plumbago: The demand continues strong for founders' and lubricating qualities at £6. to £10. per ton; prime Ceylon is steady at £15. to £20. per ton, according to quality. Pumice stone: The demand is good, ground being done at £6. to £7. per ton, and superior Teneriffe lump at £7. 10s. per ton. Bog ore is in fair demand at 22s 6d. to 25s. per ton.

### MISCELLANEOUS CHEMICAL MARKET.

In the alkali trade business continues fairly steady. Caustic soda is in good request. There are no changes to record in value during the past week. Spot quotations, subject to some variations according to market, are as follows:—F.o.b. Liverpool, 77%, £9. 7s. 6d.; 74%, £8. 10s.; 70%, £7. 10s.; 60%, £6. 10s. nett per ton, 10-ton lots and upwards. Ammonia alkali, 58%, unchanged at £3 7s 6d., bags, makers' works. Soda crystals 37s. 6d. nett, bags. Leblanc ash 1d. to 1½d. per degree, casks, f.o.r. makers' works. For bleaching powder prices are £7. per ton, softwoods, f.o.r. m. kers' works, and £7. 5s.

per ton, hardwoods, f.o.b. Liverpool, with fairly good inquiry Chlorate of potash—makers' price 47½d., resellers at 43½d. Chlorate of soda 6½d. to 6½d. per lb. Sulphate of copper has sharp rise to £19. 10s., f.o.b. Liverpool, and this price has been for early delivery. White powdered arsenic, under the extreme has now risen to £21., Liverpool, Garston, etc. Brown acetate has given way a further point during the week under pressure of Other acetates quiet and unchanged in value. Nitrate of soda and is finding ready outlet at 8s. 1½d. to 8s. 3d. per cwt. prussiate of potash quiet at 7½d per lb. Cyanides unaltered. caustic and carbonate, are in good inquiry, and prices: Ammonia and salts slightly easier all round. Green copperas request, and supplies considerably curtailed. For carbolic acid there is still good demand, and prices are firm; liquid carbolic are quoted slightly higher. Aniline oil and salt are lower. There is a general slackness in demand for all chemicals used in textile trades.

### REPORT ON MANURE MATERIAL.

On the whole business has been very quiet, but prices have fairly well maintained. It is reported that further business done in high grade Florida rock for the North Sea at recent but buyers for the United Kingdom are still holding off. Qu for South Carolina and Algerian phosphates are unchanged. River rock is now quoted 5½d. per unit, and business is being the price. There is nothing doing in River Plate bones. value of cargoes afloat is £3. 15s. Sales of crushed East India have been made for shipment at £3. 16s. 3d. per ton, ex qu pool, but for parcels in store £4. per ton is required. For £3. 16s. 3d. is asked for Bombay bone meal. On spot the £3. 16s. 3d. to £4., according to quality. Nitrate of soda is all positions, but during the week business in this article rather quieter. The value on spot is 8s. for ordinary quality 8s. 1½d. for fine. Due cargoes are worth about 7s. 10½d., quality. Home-prepared dried blood still continues to offer a f.o.r. at works.

### THE METAL MARKETS.

**LONDON, WEDNESDAY.**—Pig iron, dull: Scotch closed at 47s. 8d.; Middlesbrough, 38s. 7d. cash, and 49s. 3d. Copper, quiet: Chili bars, G. O. B.'s and G. closed at £45. 15s. to £46. cash, and £46. 2s. 6d. to £46. three months. Tin, steady: Straits closed at £60. 12s. 6d. 2s 6d. cash, and £61. 5s. to £61. 15s. three months. A £61. 5s. English ingots, £64. 10s. to £65. Lead, firm: £11. 6s. 3d.; English, £11. 10s. to £11. 12s. 6d.; spelter, ordinary, £14. 17s. 6d. to £15. Nickel, 1s. 2½d. A £29. 15s. Quicksilver: first hands, £7. 2s. 6d.; second £7. 2s. Copper shares, steady: Cape, 2½ to 2½; Copiapu, 2½ Libiola, 3 to 3¼; Mason and Barry, 2½ to 3½; Rio Tinto 18¼; Tharsis, 5 to 5¼.

**GLASGOW, WEDNESDAY.**—Market steady, with small Scotch done at 47s 7½d. and 47s. 8d. cash, also at 47s month; closing with buyers at 47s. 8d. cash, sellers ask 47s. Cleveland done at 38s. 9d. 13 days; closing with buyers at cash, sellers ask 38s. 8d. Cumberland hematite done at 4 and 49s. 4d. cash; closing with buyers at 49s. 3d. cash, sellers ask 49s. 4d. Middlesbrough hematite closes with buyers at 46s. 6d. sellers ask 46s. 7½d.

### LIVERPOOL OIL AND COLOUR MARKET.

WEDNESDAY.

**OILS.**—Palm oil is easy but steady, with a rather better doing. Lagos has been selling at £19. 10s., transit. Olive firm, and prices steady. There is a fairly good spot inquiry. is quoted £30. to £30. 10s., and Seville £29. 10s. to £30. Linseed is rather easier, Liverpool makes in export casks being 20s. 3d. to 21s. per cwt. Cottonseed is quiet, without change in Liverpool refined standing at 17s. 3d. to 17s. 6d. per cwt. is very steady, without alteration in last week's quotations. a moderate business passing. Tallow is inclined to be easier, is not much doing, as at present prices remain stationary. R continues to rule firm at 4s. 10½d. to 5s. for common, 5s. 3d. for medium, and 7s. to 8s. for fine. In consequence, there is but limited business doing. Spirits of turpentine are easier, but a better demand at the reduced price of 21s. 3d. per cwt. Petroleum is quietly steady at 6½d. to 7½d. for American, a per gallon for Russian refined.

S are steady, without alteration in prices. Lordshire, common, £10., medium, £12., best, £15. common, 40s.; medium, 50s., best, 60s.; Welsh, best, 50s., and common, 18s.; Irish, Devonshire, 40s. to J.C., 60s. to 65s.; M.C., 65s. to 67s. 6d. Umber: Devonshire, 50s. to 55s. White lead, £16. Red lead Venetian red, £6. to £10. Cobalt: Prepared oxide, 6s.; blue, 6s. Zaffres: No. 1, 3s. 6d.; No. 2, 1s. 6d. of iron: Common, £7.; medium, £10.; finest, £20. 22. 10s. to £25.

## TYNE CHEMICAL REPORT.

TUESDAY.

Chemicals is perhaps a shade better, but prices remain sulphur scarce at £3. 17s. 6d. per ton. Soda crystals, per ton, gross weight, locally. Bleaching powder, £7. 10s. Caustic, 76/77%, £9. 5s. per ton; 70%, £7. 10s. per ton.

powder, softs, £7. 5s. per ton, nett; hards, £7. 10s. per ton, soda, 76/77%, £9. 5s. per ton, nett; do., 70%, £7. 15s. recovered sulphur, 2 cwt. bags, £3. 17s. 6d. per ton, nett; do., £3. 15s. per ton, nett; do., 52%, £3. 17s. 6d. per ton, 56%, £4. per ton, nett; alkali, 36%, £2. 15s.; white alkali, 48%, £4. 10s. per ton, nett; do., 50% ton, nett; do., 52%, £5. per ton, nett; hyposulphite of soda, 5-cwt. casks, £6. 5s. per ton, nett; do., 1 cwt. kegs, £7. silicate of soda, 75° Tw., £2. 12s. 6d. per ton, nett; w., £3. per ton, nett; do., 140° Tw., £3. 7s. 6d. nett; soda crystals, casks, £2. 2s. 6d. per ton, do., 2 cwt. bags, £2. 2s. 6d. per ton, nett weight; potash, 5d. per lb., less 6%; pearl hardening, nett; pure white sulphate of alumina, £3. 17s. 6d.; blanc fixe, £7. 5s. per ton, nett; chloride of barium, £6. 15s., per ton, nett; do., 90 95% crude calcined, nett; sulphide of barium, crystals, £4. 15s. per ton, nett; alumina, £30. per ton, nett; aluminate of soda, £30.

South Durham salt is steady at 9s. per ton, f.o.b. Tees.

The general condition of trade is very slightly altered, of the collieries are working a little better. Prices to-day Northumbrian steam, 8s. to 8s. 6d. per ton; second to 7s. 6d. per ton; small steam, 3s. 9d. to 4s. per ton; unscreened, 6s. 3d. to 6s. 9d. per ton; gas coals, 7s. to 8s.; household coals, 10s. to 10s. 6d. per ton; coke, firm, 5s. per ton.

## PAINT, OIL, AND COLOUR REPORT.

TUESDAY.

Prices are little changed, with little of an extraordinary wing. The imports of seed have been well maintained, tendency to keep down values. Amongst the principal Hull up to date, compared with the same time a year ago, ed, 85,521 quarters, against 38,550 quarters; rapeseed, 28,588 quarters; coltseed, 49,919 tons, 22 tons; olive oil, 4,727 casks, against 1,767 casks; rape s, against 2,318 casks; oilcakes, 4,160 tons, against 2,475 t, 6,645 cwt., against 2,255 cwt.; turpentine, 6,167 at 2,980 barrels; bones, 1,593 tons, against 1,325 tons. remains very quiet. Spot offers at 18s. 7½d. naked, and llers at same price for March-April and May-August; last 18s. 6d.; boiled and refined ditto, £1. to £2. per ton ort for the week, 1,880 cwt. Refined cotton oil also 15s. 1½d. to 15s. 3d. naked; March-April offers at and May-August at 16s. Crude, 13s. 9d. naked, h-April quoted 14s.; casks £1. and ordinary barrels ton extra. Export of refined for the week, 9,740 cwt. tive oil, £13. per ton. Castor oil from 2½d. per lb. m £29. per tun. Cod oil scarce and in improving value. d soap, £14. per ton. Sperm oil from £23. Locomotive

Linseed cakes firm: 95% pure, £6. 2s. 6d. to £6. 5s.; 17s. 6d. to £6. 2s. 6d. Oil cakes, £5. 2s. 6d. Cotton: Best makes, £3. 12s. 6d. to £3. 15s.; seconds, £3. 10s. Black Sea, £2. 7s. 6d.; East India, £3. 7s. 6d. per ton. —These articles in good request, and makers busy. —White lead, £16. 10s.; red lead, £14. 10s.; black, n red, oxide of iron, yellow ochre, and green paints from n; linseed oil putty, in bladders for export, 8s. 6d. per emover, £1. 5s. to £1. 10s. per cwt.; ready-mixed paints, ever tins, from £24. per ton; imperial black varnish, ton, in barrels; oak varnish from 5s. 6d. per gallon.

## WEST OF SCOTLAND CHEMICALS.

GLASGOW, TUESDAY.

The feeling in this market as regards sulphate of ammonia is this week at a still lower ebb, and prompt value for the moment cannot be stated at higher than £8. 7s. 6d., f.o.b. Leith. This is the second time it has been down to this very low mark, but the feeling now is certainly more depressed than it was on the earlier occasion. Continental views expressed to correspondents here are even less favourable than they were, and the forecast of the dealers is far from encouraging. Amongst the mineral oils and paraffins a fairly good tone is maintained, with no price changes, although the tendency in lubricants is certainly towards a further advance, the call for the article being very good and increasing to all appearance. General chemicals are without any additional change except in one or two lines only, and the feeling is somewhat indifferent. Nevertheless, a definite revival of some kind is generally expected within a brief space from now.

Chief prices current are:—Soda crystals, £2. 2s. 6d., nett, Tyne; soda ash, 48/56°, £3. 15s. to £4. 15s. nett, Tyne; white alkali, 48/52°, £4. 10s. to £5. nett, Tyne; alum in lump, £5. 5s. nett, Glasgow; caustic soda, white, 74° £8. 10s., 70/72° £7. 10s., 60/62° £6. 10s., and cream 60/62° £6. 7s. 6d., all nett, Liverpool; bleaching powder, £6. 5s. to £7. 5s. nett, Tyne; saltcake, 27s. 6d.; borax, English, refined, £20., and boracic acid, £30. nett, Glasgow; bicarbonate of soda, 5-cwt. casks, £6. 10s., and 1-cwt. casks £6. 15s. nett, Liverpool; bichromate of potash, 4½d. nett, for Scotch and English deliveries (for export, 4½d. nett, f.o.b. Glasgow); bichromate of soda, 3¾d. nett, for Scotch and English deliveries (for export, 3½d. nett, f.o.b. Glasgow); chlorate of potash, 4½d. less 5%, Liverpool; nitrate of soda, 8s. to 8s. 3d.; sulphate of ammonia, £8. 7s. 6d. prompt, f.o.b. ## Notices.

All communications for the *Chemical Trade Journal* should be addressed, and Cheques and Post Office Orders made payable to—

**DAVIS BROS., 32, Blackfriars Street, MANCHESTER.**

Our Registered Telegraphic Address is—

**"Expert, Manchester."**

**NATIONAL TELEPHONE 3060.**

The Terms of Subscription, commencing at any date, to the *Chemical Trade Journal*,—payable in advance,—including postage to any part of the world, are as follows:—

Yearly (52 numbers) ..... 12s. 6d.

Half-Yearly (26 numbers) ..... 6s. 6d.

Quarterly (13 numbers) ..... 3s. 6d.

Readers will oblige by making their remittances for subscriptions by Postal or Post Office Order, crossed and payable to "Davis Bros."

Articles, reports, and correspondence on all matters of interest to the Chemical and allied industries, home and foreign, are solicited. Correspondents should condense their matter as much as possible, write on one side only of the paper, and in all cases give their names and addresses, not necessarily for publication. Sketches should be sent on separate sheets.

Communications for the Editor, if intended for insertion in the current week's issue, should reach the office not later than **Tuesday morning**.

## Advertisements.

Prepaid Advertisements of Situations Vacant, Premises on Sale or To be Let, Miscellaneous Wants, and Specific Articles for Sale by Private Contract are inserted in the *Chemical Trade Journal* at the following rates:—

10 Words and under ..... 2s. 6d. per insertion  
Each additional 10 words ..... 6s. 6d.

Advertisements of Situations Wanted are inserted at one-half the above rates when prepaid, viz.:—

10 Words and under ..... 1s. 6d. per insertion  
Each additional 10 words ..... 3s. 3d.

Advertisements intended for insertion in the current week's issue should reach the office by **Thursday morning** at the latest.

## CURRENT TOPICS.

### THE NITRATE COMBINATION.

THE long-looked for is at last accomplished, and the combination of nitrate producers has been consummated.

The terms are to apply for three years from the 1st of April, subject to certain modifications of details; thus the total shipments for the year, April 1st, 1896, to March 31st, 1897, to all countries are to be limited to 1,080,000 tons. It is quite possible that this total may be altered for the next year, as if the demand increases sufficiently to enable the price to reach 6s. per quintal at Chili, the production will be increased.

There is thus no prospect of a return to prices on the same level as was ruling in 1893, since the statistics for the past five years show that the present limit of production is about 57,000 tons in excess of the highest total consumption ever reached.

In estimating the probable outcome of the combine, it is not enough to note the decided increase in the consumption last year, as there can be no doubt that the increase in the consumption was mainly due to the excessive cheapness of nitrate. The figures since 1891 show very clearly that 1895, the year with the largest consumption, was the year of lowest prices; while in 1893, the period of very high prices, the consumption fell to 884,000 tons, the lowest total there has been in recent years.

It is probable that the price will not be advanced higher than 8s. 6d. per cwt., but, judging from past experience, there is good reason to expect that even this advance will tend to check the consumption on the Continent, while in this country its use has steadily declined in spite of the fact that nitrate was selling last autumn at 7s. 3d. per cwt. These facts would seem to indicate that there is no great likelihood of the last part of the agreement being called into play in 1897-8, since, should the demand for the growth of sugar-beets be increased in the manner expected, it is highly probable that the increase will only counterbalance the deficiencies at other points.

On the other hand, it is a great advantage for producers to know that the price will remain fairly constant for three years, and to be freed from undue competition by the distribution and regulation of the output. Such conditions will make a great difference to the smaller companies, while the larger concerns will enjoy the dual advantage of working profitably and conserving their resources.

### SEWAGE FILTRATION.

The question of land filtration as opposed to artificial methods has long been a vexed question, and, as has frequently been pointed out, land filtration is undoubtedly an excellent system under suitable conditions. But in the discussion of this question the advocates of land filtration seem to have lost sight entirely of the all-

important influences of circumstances. Because the land system is undoubtedly good they appear to insist upon its adoption, regardless of the fact that Utopian methods are not always the best.

The merits and demerits of a process do not lie so much in its intrinsic features as in general applicability and the advisability of adapting those features to ordinary existing circumstances. It is on these grounds that methods of artificial filtration demand consideration. Wherever land filtration is feasible, adopt it by all means. In the case of large towns, however, in the majority of cases suitable land is not available, and if it is the price is prohibitive.

The Local Government Board, by their present system, set a premium on the inefficient filtration of sewage effluents, and how much depends on this stage, as contrasted with the mere precipitation, only those who reside near the Ship Canal can fully appreciate. It is therefore pleasing to find this conviction coming home to those who make comparative observations of methods of sewage treatment. Dr. J. Haddon has felt compelled to express himself in print, and whatever his personal views may be, his words afford additional testimony to the fact that the unqualified enforcement of land filtration pure and simple is being carried too far, and that it is high time our mentors began to inform themselves upon both sides of this most important question.

## SOCIETY OF CHEMICAL INDUSTRY.

### MANCHESTER SECTION.

THE fifth meeting of this section was held on the 6th inst., at the rooms of the Chemical Club, Victoria Hotel, the chairman, Mr. Geo. E. Davis presiding.

A paper was read by Dr. Stevenson Macadam (Edinburgh), on "Destructors for Consuming Town Refuse: Their requirements, defects, and modes of improvement." After briefly explaining the reason of his appearance before the section, the author reviewed the various methods of dealing with the refuse, which he was of the opinion did not differ materially in various towns. The conditions he considered it necessary for an efficient destructor to fulfil were:—1st, to burn the inflammable portions into an innocuous gas; 2nd, to give good cinders, which would burn without allowing bad gases to escape; 3rd, to yield a good glassy clinker suitable for cement making and kindred purposes. He then described the construction of the five leading types of destructors, including Fryer's, Horsfall's, Meldrum's, Beeman and Deas's, and the Leeds District patterns. He emphasised the advantages and disadvantages peculiar to each, owing to the lack of forced draught arrangements or insufficient size of grate to burn up the gases. He was not in favour of cremators. He himself had as yet never actually seen one at work, the fires always being out. He considered an efficient destructor should do its own work, and not need the aid of a cremator. The doctor then proceeded to describe what he considered would be an ideal destructor. Where the cells worked separately there was no depending on the total absence of smell, but two cells or more would give good results, and he described such an arrangement, in which all the gases from the "stewing" stage were passed through the cell in the "cinder" stage before passing to the flue. He maintained that the failure of many destructors was due to unintelligent working, and that all destructors ought to be worked by, or be under the supervision of, a capable workman. With regard to the great nuisance experienced by the escape of dust up the chimney, he urged the careful removal of the clinker and that only. He did not think rocking bars an advantage. The gases on their passage to the chimney, if passed through a chamber having an area about four times that of the flue, deposited practically the whole of the dust, and this way he had found to be the only efficacious method of treatment. The dust from the destructors, examined microscopically, could always be recognised, and it was extremely light.

In the discussion that followed, the Chairman referred to his own experience with cupola dust, and the dust from McDougall's pyrites burner, which he had found to be of the same vesicular nature as the dust from the destructors.—Mr. Thompson (Manchester) asked for further information about the dust settling chamber, since such a small chamber effected such a large reduction in the rate of the flow of the gases. He certainly thought destructors should be so designed as to utilise the heat generated.—Mr. Stenhouse (Rochdale) pointed out

one or two things which he thought were against the method by the process. From his own experience he was inclined to think that necessitated great care in working was objectionable suggested a modified dust chamber.—Mr. Corbett (Salford) his experience with destructors. He emphasised the low temperature that were frequently attained, having by actual experiment for case that the flue gases would not evaporate water.—Mr. Syke referred to the Heeley destructor, illustrating his description on blackboard. He was in favour of rocking bars.—Mr. Flintoff (Rochdale) said he obtained a temperature of 2,000° F. he was adverse to anything that meant complication and skill in construction.—Mr. Hall (Salford) and Mr. Deas (Warrington) also took part in discussion.—After a few remarks from the Chairman, Dr. Macadam briefly replied. His scheme, he said, was as yet only on paper, and was not intended for a meeting, which terminated with the usual votes of thanks, and the fullest this session, being largely attended by a number of men interested in the subject of the paper. Mr. Thomas T. Flintoff (president of the society) was also present.

The reading of Mr. Flintoff's paper on "The functions of a fixing agent for pigments on cotton" was adjourned to the next meeting.

### LIVERPOOL SECTION.

The Liverpool section met at the Chemical Laboratory, University College on Wednesday, 4th inst., under the presidency of Dr. Schack-Sommer. The Chairman read a communication to the Sorghum sugar industry of Spain. Dr. Kohn exhibited a series of lantern slides some interesting results recently obtained through the agency of the much-discussed Röntgen rays. An interesting paper was subsequently read by Mr. E. H. Saniter on his preliminary analysis of chrome-ore and ferro-chrome. The efficiency and exceeding rapidity of the processes were shown by Mr. Saniter, who gave the details practically, before his audience, during the reading of the paper.

At the next meeting, to be held on April 1st, Mr. James I. recently returned from Sweden, will give an account of the cellulose industry of Scandinavia.

### NOTTINGHAM SECTION.

A well attended meeting of the local section was held on Wednesday evening, the 4th March, at the University College, Nottingham, amongst those present being Dr. Clowes, Dr. Sudborough, Caven, Forth, Golding, Jackson, Pentecost, Ward, and other Derby members were represented by Messrs. Carulla and C. C.E.—Mr. Ward (acting for the hon. sec.) read the minutes of the previous meeting, which was held in Derby, after which the Chairman (Mr. Carulla) explained that imperative business had called him away to London that day, but he had provided a short paper on "An evaporation test for cylinder oils," which was read at the meeting. The test consists in taking a weighed quantity of cylinder oil and observing the loss of weight caused by the current of air or steam over it in an appropriate apparatus. The author finds that this test gives a more useful (quantitative) result than the merely qualitative test of the flashing point with certain trouble. The Chairman said that in the absence of the author he was courteous not to discuss the subject, and especially as a full paper was promised for the May meeting, which could come well prepared after what they had heard.

The recent paper by Mr. R. M. Caven on "Some Properties of Ferric Phosphate," set down for discussion, was then recapitulated by the author.—Dr. Clowes said he hoped the plan of reading a paper and discussing it at a subsequent one might be frequently adopted, as it had obvious advantages. This resolution has some influence on our present analytical tables, which certainly have to be modified; and he wished to put it on record that there was much original work to which, in his modesty, he did not lay claim to in the paper. Mr. Caven, however, had not trodden on the fringe of the subject, and he (Dr. Clowes) thought the author might find time to continue his investigations.—Mr. Caven, in his reply, admitted that it would have been better, as Dr. Clowes suggested, to have used only the term " $\text{PO}_4$  radicle" throughout. He went over the various points raised, as to the colour in solutions by the presence of  $\text{FeCl}_3$ , and the subject of analytical solutions. He also replied to the question of Mr. Wilkinson about no precipitation occurring after the addition of ammonia in a solution of ferric phosphate, containing a salt of zinc, and to another of Mr. Forth regarding the quality of the ferric phosphate employed, which was

Time still remaining, Dr. F. Clowes very kindly offered a paper on "The estimation of oxygen by an alkaline solution of pyrogallol," which the meeting gladly received. Dr. Clowes said that exact had been regarded by some people as unmixed evils, but at least one case in which good had resulted from the

time ago samples of commercial oxygen were given out for analysis at an examination, when all the students returned them as containing carbonic oxide, which was not present in the samples. On investigating the subject it was found that in a mixture of gases, when tested by pyrogallic acid under certain conditions, if oxygen largely preponderates carbonic oxide is evolved from the re-agent. Dr. Clowes acknowledged his indebtedness to Mr. Jackson for assistance in carrying out these experiments. Messrs. Caven and Ward joined in the discussion of the paper, the Chairman remarking that he was pleased to infer from what had been said by Dr. Clowes that the error was not present in the test of the exit gases from sulphuric acid chambers, in which oxygen was present in only a small proportion, and with which he (the chairman) was interested. It was announced that the next meeting will take place in Derby, early in April, when Mr. John White, F.I.C., will read a paper on "Filtration and domestic filters." It was also announced that on Thursday, March 26th, at 8 p.m., Professor Ramsay will give a lecture at University College, Nottingham, on the newly-discovered gases, Argon and Helium. The meeting then terminated.

### MOLASSES POTASH FOR SOAP-MAKING.

A CONSIDERABLE quantity of potash is obtained from the alkaline salts of the sugar beet, which are left in the molasses after the separation of the sugar, in the course of the manufacture of this latter product. After converting the molasses into spirit, the residue is concentrated and carbonized, yielding a crude potash of the following average composition:—

|                    |                        |
|--------------------|------------------------|
| 24 to 50 per cent. | carbonate of potash.   |
| 17 to 26 "         | carbonate of soda.     |
| 16 to 21 "         | chloride of potassium. |
| 3 to 13 "          | sulphate of potassium. |
| 14 to 22 "         | insoluble matter.      |

In this condition the potash is unsuitable for soft soap manufacture, on account of the quantity of soda present; but on the removal of the latter, by the aid of extraction with water and repeated recrystallization, a refined potash is obtained suitable for the manufacture of soft soap in the summer. Its constitution is then as follows:—

|                    |                        |
|--------------------|------------------------|
| 80 to 91 per cent. | carbonate of potash.   |
| 2 to 5 "           | carbonate of soda.     |
| 1 to 3 "           | chloride of potassium. |
| 1 to 3 "           | sulphate of potassium. |
| 1 to 10 "          | water.                 |

For natural grain soaps this potash contains too large a quantity of soda for the production of a good grain, and for soft soaps it should only be employed in summer or warm weather, the soda rendering the soap liable to harden in the cold season of the year. On the other hand, in summer it is not necessary, as is the case when working with 98 per cent. mineral potash, to add soda lye in order to obtain a soap that will resist the summer temperature—that is, provided the oil used contains a little stearine. When, however, a pure linseed oil soft soap is to be made with molasses potash an addition of soda lye will be requisite to give the necessary consistency. The process is performed as follows:—According as the soap is to be ground with carbonate or other salt solution, or to be filled with potato flour, the potash is mixed with 45 to 55 per cent. of lime to form a 33° Bé. lye. The first extract of 30° Bé. strength is run into a special vessel, and the strong slaked lime is mixed with a 4° to 6° Bé. potash lye, which should be well crutched in, so that no trace of deposited lime remains undissolved. In the absence of potash lye water may be used. The resulting lye, after the lime has settled down—which will require between five and twelve hours—is of 18° to 22° Bé., and this is run into the first extract until the mixture indicates about 24° to 25° Bé. A sufficient quantity of this being placed in the copper and raised to boiling heat, the oleine is gradually added, and if the boiling has been properly carried out the stock soap may be regarded as finished. Any rosin that is to be used as filling should be now added, broken up into small pieces, and left overnight to dissolve, without any fire, but with the furnace door and damper closed, and by the morning will be ready for the fitting lye, which consists of the necessary amount of 30° Bé. extract. Soap prepared in this manner will yield well, and form a stable and clear stock soap, and when filled or ground will, provided these operations are carried out properly, with the right proportions of potato flour or salt, give a clear and bright soft soap.

Molasses potash is also suitable for ammonia and turpentine, clear elain, or silver soap in summer, on account of its containing the amount of soda necessary to the production of these soaps. The use of this potash likewise influences the yield of the product. It is well known that the addition of soda lye, although necessary to impart consistency and structure to the soft soaps, causes a decreased yield; and, though

at first sight the presence of soda in molasses potash might be considered disadvantageous, it is found that the associated potassium chloride counteracts the tendency referred to.

Although in the cold season the soda in molasses potash causes soft soap prepared by its aid to solidify too readily, this objection does not hold good in the case of the other soaps mentioned above, the soda and potassium chloride present being indispensable to their production.

A word of caution to buyers of such potash and soda, either as caustic or carbonate, may not be out of place. It is to be careful to get a guarantee from the vender, of the percentage composition of the articles. The adoption of this precaution may save a deal of trouble and dissatisfaction, often incurred without any redress. For instance, an impure potash will sometimes contain as much as 39 per cent. of soda and only about the same amount of potash, such a mixture being eminently unsuitable for the manufacture of soft soap, and calculated to cause the party using it, without knowledge of its composition, to spoil a whole batch of soap without any chance of making a claim for damages—a condition of things a guarantee would entirely obviate.

### EXPORTS OF ALKALI AND BLEACH.

THE following returns, which are taken from the official foreign and colonial statistics of the United Kingdom, give the amount and value of alkali and bleaching materials shipped to the undermentioned countries for month ending January 31, 1896, as compared with 1895:—

#### ALKALI.

THE SALFORD TECHNICAL SCHOOL.—We learn that the warming and ventilating of the new building has been carried out by the Blackman Ventilating Company, Limited, on lines known as the "Blackman Twin Dual System."

ILLEGAL SALE OF ARSENIC.—At Chester, last week, Messrs. Dicksons, Limited, seedsmen, were summoned by the Pharmaceutical Society for selling a tin of weed-killer containing arsenic, in contravention of the Pharmacy Act, the object of which is to protect the public against the sale of poisons by other than qualified persons. A society's agent purchased the weed-killer, which, analysis proved, contained two pounds of arsenic, enough to kill seven thousand persons. A fine of 20s. with costs of court was imposed.

TRANSIT OF LIQUIDS BY POST.—At a recent meeting of the Chemical Trade Section of the London Chamber of Commerce attention was drawn to the restrictions placed upon the chemical industry in the United Kingdom by the regulation of the British Post-office forbidding the sending of liquids in bottles. This barrier to the transmission of samples of liquids by post was held to be a cause of serious injury to the trade in chemicals. It was stated that from other European countries, not including Italy, however, sample bottles of liquids could be sent by post to India, the United States, and other parts of the world, and this facility was an obvious advantage to manufacturers on the Continent. It was resolved that an effort should be made to obtain the same privilege in the United Kingdom, and a committee was appointed to make representations to the Postmaster-General, with a view to a removal of the disability under which manufacturers and merchants now carry on business in this country.

## KESTNER'S ACID ELEVATORS.

THE elevation of acids is always a troublesome matter, and the use of compressed air has long been used in conjunction with the "acid egg." The elevator that we are about to describe is a great advance on the old-fashioned egg. The advantage of automatically feeding the Glover from the chambers is great, apart from the concurrent economies in labour and compressed air. For this purpose only one type of the apparatus is made, which is capable of raising 100 to 300 gallons of acid per hour. Three elevators are generally sufficient for one set of chambers, though a fourth is sometimes provided as a reserve. Special elevators on this principle are also made for hydrochloric acid.

The apparatus is composed essentially of a cast-iron body **B** (which, when employed for weak acids, must be lined internally with lead) and of a box **D** (shown open) connected with the body **B** by a vertical pipe **T**. The apparatus receives its feed by the pipe **T<sub>2</sub>**, which is provided with a stop-valve **M**. The discharge pipe **T<sub>1</sub>** is formed by a branch from the feed pipe **T<sub>2</sub>**.

The box **D** contains a valve **S**, which alternately opens and closes the inlet (*a*) and the exit (*b*) for the compressed air. The movement of this valve is effected by a counterpoised float consisting of a cylindrical lead body **XY**, filled with acid and situated in the cylindrical space in the upper part of the body of the apparatus. The float **XY** is connected to the valve by a rod (*c*) placed in the pipe **T**, and is balanced externally by a counterpoise **P**, so that the effective weight of **XY** is the weight of the liquid which it displaces.

**GF** represents the highest level allowable in the reservoir from which the elevator is fed. If this precaution be observed it is impossible for the acid ever to come into contact with the valve or other arrangement in the box **D**.

## MODE OF WORKING.

The apparatus works by pulsations in two periods—a feeding period, during which it is filling with acid through the pipe **T<sub>2</sub>**, and a discharging period, during which it is emptying itself by the pipe **T<sub>1</sub>**. During the first period the weight **XY**, acting upon the valve **S**, closes the air inlet (*a*) and opens the outlet (*b*). As soon as the apparatus is filled, the weight of **XY** becoming *nil*, the action of **P** causes the valve to open the inlet (*a*) and close the outlet (*b*). The compressed air rushing in immediately closes the feed stop valve **M**, and, the acid finding no other outlet, is discharged by the pipe **T<sub>1</sub>**. The internal pressure holds the valve **S** against the opening (*b*), the diameter of which is greater than that of the opening (*a*), until the apparatus is completely emptied and air escapes by the pipe **T<sub>1</sub>**. At this point **S**, being no longer maintained in its position by the internal pressure, falls to its original position, closing (*a*) and opening (*b*), with the result that another filling and discharging takes place.

The delivery of the apparatus varies with the pressure of air employed. It is proportional to the quantity of compressed air admitted, and may be regulated either by the compressed air tap or by the traverse of the valve **S** (which may be externally regulated) or by the acid feed.

KESTNER'S ACID ELEVATOR, FEEDING GAY LUSSAC AND GLOVER TOWERS AUTOMATICALLY.

## Reports of Companies.

### LEVER BROTHERS, LIMITED.

The directors of Lever Brothers, Ltd., in their report for the year ended Dec. 31st last, state that the balance standing to the credit of profit and loss account (£207,369.) has been appropriated as follows:—Dividends on preference shares at the rate of 5 per cent. per annum and on ordinary shares at the rate of 10 per cent. per annum; bonus to customers, £39,883.; carried to reserve fund, £30,000.; balance carried forward to next account, £24,985. The above dividends on the preference and ordinary shares were paid on July 1st, 1895, and January 1st, 1896. The bonus to customers was paid on August 1st, 1895, and February 1st, 1896. The business has continued to increase in all departments, and it has been found necessary to extend the producing power of the works. To meet the growth of the business it is proposed to increase the capital, and, accordingly, resolutions were submitted to meetings held at the conclusion of the ordinary meeting for the creation of 25,000 preference shares of £10. each and 25,000 ordinary shares of £10. each. The preference shares will be offered to the holders of preference shares whose names appear upon the register of members on March 24th, 1896, in proportion to their existing holdings, at a premium of £1. per share, thus increasing the reserve fund by £25,000. The ordinary shares will be subscribed for by existing holders of ordinary shares.

### NOBEL DYNAMITE COMPANY.

Advice has been received from Vienna to the effect that the directors have resolved, as in the previous year, to propose a dividend of 25 per cent., after writing off 600,000fl. and paying into the reserve fund the amount required by statute.

### PETROLEUM DEVELOPMENTS IN RUSSIA.

ADVICES from Russia point to an enormous increase in production not only in old, but in new territory. One of the largest naphtha springs that has been known in the Caucasus for many years has lately been struck, spouting about 500 feet high, and flowing at the rate of a million pounds (20,000 tons) a day. Large natural lakes have been formed, and in the Terek territory, where the oil was discovered, dams have been erected in the valleys to retain the oil, which will prove a great addition to the world's supply. The Grosnia oil fields, which are situated in the vicinity, are in the south of Russia, and their importance rival the oil regions of Baku. From America (says the "British and Colonial Importer") we also learn that supplies have materially augmented, and the stocks in Pennsylvania and Lima have rapidly accumulated, making the total for this year about double that in 1894. The statistical position is thus rendered more unsatisfactory to holders by the fact that deliveries of petroleum oil in the States have fallen much behind the receipts; and the expectation of a stronger demand arising out of an extended use of the article seems to be a long way from fulfilment. Meanwhile, it is highly necessary that fresh outlets should be found for the consumption of mineral or burning oils, to preserve an equal balance between the quantities produced and delivered at the principal centres of the trade; for it does not conduce to the best interests of importers, dealers, or consumers for petroleum oil to be too dear at one time for the business generally to be in a thriving condition, nor too cheap at another period for leaving a fair margin of profit for its freer consignment and distribution.

Either extreme of depression or buoyancy, when it is witnessed, indicates an unhealthy state of the market, and cannot be calculated to lead to an active and wholesome amount of dealing in the article anywhere. We had a convincing proof in April last of the disturbance occasioned to trade by speculators suddenly coming forward as buyers at exceedingly low rates, when the London quotations for standard American on the spot leaped up from 5½d. to 9½d., or 4d. per gallon, within the space of three weeks; and when, moreover, operations at all the chief depôts came to an abrupt standstill. A similar spurt is likely to occur again whenever the opportunity offers, the same as a further heavy reduction in value would speedily ensue if prices were abnormally high through a mischievous interference with the natural course of supply and demand. At present, however, neither of these changes is expected to take place, as there is nothing in the general outlook for petroleum oil to make an extensive rise or fall in the current rates easy of accomplishment. Still, if great producers of mineral oil resolve to undersell each other almost to the verge of ruin, so as to gain a virtual monopoly of the import trade, serious consequences may follow, and such an event, which is the only peculiar one operators have to apprehend just now, is well within the range of probability.

## TRACTS OF LATEST COMPLETE SPECIFICATIONS.

abstracts are specially prepared for the Chemical Trade Journal  
RIGHTS of publication are RESERVED. This is the earliest  
of abstracts of Chemical and allied patents accessible to the

and Filtering Process and Apparatus. F. H. Eydmann, 161, Rotter-  
dam, Weg, Delft, Holland. Eng. Pat. 2,722. February 7, 1895.

fluid to be filtered is passed through tubes, the inner sectional  
which is made to decrease, in the same ratio as the volume of  
fluid is diminished, by the abstraction of the filtrate. The speed  
of the fluid is thus kept constant. The maintenance of the high speed  
prevents the pores clogging, and saves constant washing. The tubes  
are constructed as follows:—An outer tube, provided with outlet holes  
for the filtrate, is fitted internally with lugs that support a tube of wire  
gauze. Inside the gauze the filtering medium is placed in the form of  
a cylinder, made of asbestos board, or cloth, etc. The liquid  
passes through this tube passes through the asbestos board into the  
space between the wire sheath and the outer tube. The  
of the sectional area previously referred to is achieved by  
a tapering mandril, as it were, within the inner tube. This  
may be hollow or solid, and provided with outer helical webs  
which maintain it in its central position, while the same in some cases  
mixing the fluid being filtered. Batteries of these tubes are  
used, there being six drawings showing various arrangements.

Improvements in Purifying Acetates. A. R. Scott, Carntyne Chemical  
Works, Parkhead, Glasgow, and T. Henderson, 29, Bath-street, Glasgow.  
Pat. 6,711. April 2, 1895.

In view to expeditiously and economically purifying acetates,  
particularly those contaminated with tarry matters, owing to their  
distillation from wood, the solution of acetate is boiled  
with a solution of soda. The effect of this operation is to  
or otherwise alter, the impurities, so that what remains in the  
becomes precipitated, and settles to the bottom. After cool-  
ing the supernatant clear liquor may be decanted, and will  
be crystals of the acetate. The hypochlorite is added until the  
solution, after boiling, is clear, and of a comparatively yellow  
color. Ordinary bleach may be used as the source of the hypochlorite.

Preparation of Assimilable Iron Compounds. O. Inuray, 28, Southampton-  
row, London (communicated by the Farbwerke vormals Meister Lucius  
and Brüning, Höchst a/M., Germany). Eng. Pat. 7,169. April 8, 1895.

that has been previously freed from coagulated albumen and  
is treated with milk of lime, or any other salt giving a  
precipitate with phosphates in a neutral solution. Any excess of  
lime in the filtrate is removed by carbon dioxide, sulphuric or  
hydrochloric acid, and finally the assimilable iron compound is precipi-  
tated from a hot solution by ferric chloride or other iron salt. The  
precipitate when washed and dried, is a heavy brown powder, containing  
10 per cent. of iron.

Improved Composition for Purifying Water in Reservoirs and  
and in Steam Boilers. L. Lachery, La Bassée, Nord, France.  
11,289. June 8, 1895.

The composition is stated to be capable of purifying water  
cold in the course of a few hours, and to act immediately when  
The mixture is of a complex nature. The main ingredients are  
sugar, molasses, potato flour, tannin, glycerine, caramel, and  
small percentage of silver nitrate, mixed with a solution of  
"cachou" (extract of *mimosa catechu*), and neutral oxalates of  
mixed with oxalic acid and sufficient organic matter to hold them.  
Equal parts of the above and neutral sodium phosphate may  
be used. Special instructions are given for the preparation  
of "cachou." For the exact proportions the specification must  
be consulted, but the four first named articles constitute 77 per cent  
mixture.

## The Ship Canal and Chemical Trade.

## FEBRUARY EXPORTS OF SALT.

The shipments of Cheshire salt during February from West-  
Runcorn lay-by, and other Ship Canal ports, were much a  
average, the trade, both coastwise and foreign, having in-  
creased activity. Of white salt 1,323 tons were shipped from  
Point, and 5,606 tons from Runcorn, &c., a total of 6,929 tons  
5,159 tons in January. The total shipments from the Mersey  
month were 32,554 tons. There were also shipped from I.  
and the Ship Canal ports 3,424 tons of rock salt.

## LOGWOOD IMPORTS.

Two sailing vessels laden with logwood from the West India  
at Falmouth last week, and were ordered to Manchester to dis-  
These are the *Vanse*, 432 tons, from the Black River, Jama-  
the *Vigilant*, which sailed from Laguna on December 30th  
vessels left Falmouth for the canal on Saturday. The *Acadie*,  
and *Heveskes II.*, 390 tons, are also reported fixed for Manche-  
cargoes of logwood from Jamaica.

## PITCH EXPORT TRADE WITH FRANCE.

A business of considerable magnitude is now being done  
exportation of coal-tar pitch from Manchester to the West of  
of France by way of the Ship Canal, and during the past  
months quite a large amount of both steam and sailing ton-  
nage has been requisitioned for this trade. The bulk of the shipments  
have been to the ports of St. Nazaire (Loire Inférieure) at  
(Hérelault) but a new departure has been made in the shipment  
Pomona Docks of a large consignment to Les Sables d'Ole  
railway port in the Department of Vendée—by the steamer *M.*  
tons register, which sailed on Tuesday. Another large cargo  
for France is now being loaded at No. 7 Pier by the steamer *C.*  
tons register, the port of destination in this case being Cete  
steamer *Eviva*, which met with an accident near Eastham whi-  
voyage from Manchester to Cete with pitch, is now undergoing  
at Birkenhead.

## EXPORTS OF PETROLEUM FROM U.S.

THE Chief of the Bureau of Statistics, Washington, gives the  
following returns of the exports of petroleum and petro-  
products for January, 1896. The total shipments were 77  
gallons, compared with 77,264,410 gallons in 1895. The total  
seven months ending January, 1896, was 528,453,772  
against 550,561,275 gallons during the same period in 1895.  
Details of the shipments are as follow:—

| CRUDE PETROLEUM.          |       | Gallons.  |
|---------------------------|-------|-----------|
| Total, January, 1896      | ..... | 6,159,99  |
| " " 1895                  | ..... | 9,287,97  |
| NAPHTHAS.                 |       |           |
| Total, January, 1896      | ..... | 1,572,67  |
| " " 1895                  | ..... | 1,377,53  |
| ILLUMINATING.             |       |           |

| Total, January, 1896      | ..... | 43,34     |
| " " 1895                  | ..... | 10,11     |

## INJUNCTION AGAINST THE PLYMOUTH GAS CO.

IN the action brought by Mr. William Osmond Ward against the Plymouth Gas Company in the High Court of Justice a verdict has been given for the plaintiff, and an injunction granted. Mr. McColl, Q.C., and Mr. William Graham, Q.C., instructed by Messrs. Wilson and Loye, represented the plaintiff; and Sir Edward Clarke, Q.C., Mr. Channel, Q.C., and Mr. H. E. Duke, instructed by Messrs. Shelly and Johns, the defendants. Plaintiff, who owns a tannery adjoining the gasworks, claimed damages and an injunction to restrain the defendants from carrying on their business in such a way as to cause a nuisance. In the pleadings it was stated that plaintiff had for 20 years, until September, 1894, carried on his business without experiencing any annoyance from the gasworks, although the old retort-house was situated on the southern side of the tannery, and his drying lofts extended close up to the company's northern boundary. In the year 1893 the company, on land purchased from the plaintiff, commenced the erection of a new retort-house, extending in front of and beyond plaintiff's drying lofts, there being a distance of only 20 yards from the southern end of the drying lofts to the new retort-house. The new block was completed in September, 1894. In this retort-house the company adopted a new process. Simultaneously with the opening of the new works a nuisance was created. When south, south west, and south-east winds prevailed, volumes of smoke, charged with fiery, black dust, were emitted from the new retort-house, and settled over all the plaintiff's premises, internally and externally, the dust finding free admission through the open louvres and windows. It covered the floors of the premises, and settled on both the open liquor pans and on the leather in the various stages of manufacturing process. Much dust was also created by quantities of hot coke being stacked against the boundary wall dividing the gasworks from the tannery. The effect of the deposit of dust upon the leather while in a half-dry state was to soil and make it altogether unsaleable, and plaintiff had to take special precautions to keep the leather clean.—As the result of private consultations between the counsel engaged in the case, it was agreed that a verdict should be entered for plaintiff with costs, and an injunction granted to restrain the defendants from carrying on their business in such a way as to create a nuisance, the damages to be assessed by an official referee.—The Lord Chief Justice gave judgment accordingly. It is understood that several other owners of property at Coxside intend suing the Gas Company for damages and an injunction on similar grounds.

## IMPROVED TUBE FOR OBTAINING X-RAYS.

ON Wednesday, 4th inst., Mr. A. A. Campbell Swinton read a paper before the Society of Arts on "Röntgen's Photography of the Invisible." Mr. Swinton began by giving an account of some of the phenomena of electrical discharge in high vacua, mentioning particularly the properties of the cathode rays. Passing on to deal with Röntgen's rays, he discussed the conditions on which the opacity or transparency of a particular substance seemed to depend, and also showed experimentally their property of discharging a body charged with either positive or negative electricity. He went on to consider what was the best form of Crookes's tube to employ for photography of the invisible, and described a new tube from which he had obtained superior results. In it, he said, the cathode plate was concave, so as to focus the cathode rays upon a point on the piece of platinum foil forming the anode. The foil was bent at an angle of 45 deg. to the direction of the cathode rays so as to throw down the Röntgen rays, which in this case proceeded from the platinum, not the glass. The advantages of this tube were that it gave a sharpness of definition otherwise unattainable, and that there was less chance of the glass being cracked by heat. It appeared to him to represent the most important advance yet made in connection with the apparatus required for the practical applications of Röntgen's photography. As to other points in the construction of the tube used, he said it must be made of soda, not lead, glass. Further, it must be exhausted to a very high degree, though what exactly was the best degree of exhaustion was uncertain. The best plan was to keep the tube connected with a mercury pump, so that the exhaustion could be varied at will. He found that even a sealed-up tube would not retain the same exhaustion from day to day owing to absorption of residual gases by the electrodes, condensation on the glass, &c. In conclusion, Mr. Swinton exhibited an apparatus, similar to that described by Professor Salvioni, of Perugia, in which the property possessed by platino-cyanide of barium, among other substances, of fluorescing under the influence of the Röntgen rays was utilised so as to make it possible to see such things as coins in purses, and even the bones inside the hand. The actual process of photographing by Röntgen's rays was shown during the course of the lecture, and a large

number of photographs of the human hand and foot, fish, animals, &c., were exhibited on the screen.

In proposing a vote of thanks, Professor Dewar (the chairman) said that, by his activity in bringing forward Professor Röntgen's results, Mr. Swinton had done a real service to science. For of real science it was impossible to have too much popularity, and the more the public were interested in scientific discovery the more secure was the position of England. At any rate, there would be no possibility of intellectual isolation. The discovery, perhaps the most extraordinary of the last half century, which we owed to Röntgen, was one to be thankful for because of the stimulus it had given to scientific inquiry. But it had also stimulated a kind of criticism which he felt ought not to be entertained. This was the theory that a discoverer had a monopoly in his discovery. In science there was no monopoly. A man who made a discovery gave a gift to science. He himself had not the pleasure of knowing Professor Röntgen, but he was sure that the latter, so far from thinking that Mr. Swinton in bringing forward this subject was detracting from his fame, would feel that he was but adding fresh laurels. To say that one man, locked within his own laboratory and, as it were, cultivating alone his own little garden plot, could have done as much as had been done by united effort in a few months was preposterous. Such a theory would retard the progress of science, and was, he thought, based on too great consideration for the personality of the discoverer. As to the nature of the Röntgen rays, Mr. Swinton, like other persons, was not inclined to commit himself. Professor Dewar himself felt that we were on the dawn of new knowledge about the material medium known as the ether.

## THE GRASSELLI CHEMICAL CO.

A VISIT was recently paid by the members of the American Chemical Society to one of the works of this well-known company, who operate ten different works in various parts of the United States, one of the largest being the works visited by the members at Cleveland. The plant and processes inspected may be summarized as follows:—

**Sulphuric Acid.**—Several systems are operated for burning lump and fine ore, the latter being especially adapted for such work. Only pyrites is burned, obtained from different parts of the States and abroad. The construction of these plants was found to be modern, and the equipment equal to the best.

In connection with these systems are the concentrating plants where sulphuric acid in large quantities is concentrated to its various commercial strengths.

**Nitric Acid.**—In this plant nitric acid was seen in process of manufacture from Chili saltpetre on a large scale. In connection with this was a plant for the production of different grades of acid for the trade.

**Hydrochloric Acid.**—This plant comprises various modern devices for the manufacture of numerous qualities of muriatic acid. Sodium chloride and nitre cake are used to a large extent. Salt cake from these plants is worked up in large quantities and sold to glass manufacturers.

**Mixed Acids.**—In this department sulphuric and nitric acids of proper strengths are mixed in such proportions as the trade demands, and sold in large quantities to dynamite manufacturers.

**Glycerine.**—This plant is adapted to the manufacture of chemically pure glycerine, which is obtained on the large scale from crude glycerine by distillation with steam. This department has achieved considerable reputation for the quality of the product, which is equal in every respect to any in the market. Great care is exercised in this manufacture, and many chemical tests made to insure a high-grade article. A beautiful product is made, and each visitor was presented with a small bottle as a souvenir.

**Ammonia.**—In this extensive plant large quantities of ammoniacal liquor are worked up into all grades of aqua ammonia, ammonium sulphate and other ammonia products.

**Laboratories.**—The different laboratories were visited, and chemists were found busy in many operations of interest to the analytical and research chemist.

The extensive shops of the company as well as the sal-soda and Glauber's salt plants were also visited.

**MESSRS. DOMEIER AND CO.**—We are informed that this firm has been appointed agent to the Electrochemische Werke Belin, for the sale of their calcium carbide, metallic sodium, and caustic potash. Messrs. Domeier's offices are at 13, St. Mary-at-Hill, London, E.C.

**SERIOUS FIRE AT A PRINTWORKS.**—A very disastrous fire occurred late on Sunday night at the extensive printworks of Messrs. Salis Schwabe and Co., at Middleton, near Manchester. A large building was destroyed, together with vast quantities of cloth and machinery. The damage is estimated at £80,000.

## Trade Notes.

**FOOD ADULTERATION COMMITTEE.**—The Select Committee of the House of Commons appointed to consider the question of food products adulteration met last week, and elected Mr. T. W. Russell chairman. They met again on Tuesday for the purpose of taking evidence, when the first witnesses were Mr. Lloyd and Mr. Hehner.

**SINKING OF A MANURE CARGO.**—Last week the flat *Energy*, belonging to Mr. William Burton, of Liverpool, laden with manure, was sunk in the River Mersey, just outside the Ship Canal, Weston Point. The vessel was making for the Weston Mersey Lock to enter the Canal, when she forcibly struck the outer wall. She was damaged so seriously that within a few minutes she sank. Captain Horton and mate escaped. The wind was very strong at the time.

**A LARGE GLASSWORKS ABOUT TO CLOSE.**—On Saturday, 8th inst., the notices of 350 men employed at the glassworks of Messrs. Hartley and Co., Sunderland, expired. It was expected that on Saturday the works would have closed. An interview, however, subsequently took place between representatives of the masters and men, and the men's delegates were informed that their notices would be extended another week. No reason is assigned for the dismissal of the men, and there has been no dispute.

**SALTERS' COMPANY'S RESEARCH FELLOWSHIP.**—The executive committee of the City and Guilds of London Institute have awarded the second Salters' Company's Research Fellowship, for the encouragement of higher research in chemistry in its relation to manufactures, to Mr. Sidney Williamson, Ph.D., F.I.C., F.C.S., who was for two years a student at the City and Guilds Technical College, Finsbury, and subsequently for three years at the City and Guilds Central Technical College. The fellowship is tenable at the latter, and Mr. Williamson proposes to work on some questions bearing on food-stuffs generally, more particularly the examination of some definite albumenoids, with the ultimate object of ascertaining the influence of various manures on the growth of crops in so far as *quality* of produce is concerned.

**MERSEY RUBBER CO., LTD.**—A meeting of the creditors of this company, whose works are at Bank Quay, Warrington, was recently held in the offices of the Official Receiver in Bankruptcy. Mr. W. J. Warley, official receiver of the High Court, presided. The company was formed in March, 1894, and a winding up order was made on the 15th January of this year. Mr. Warley pointed out that a final statement of accounts had not yet been filed, but it appeared that the liabilities were roughly £22,278., and the estimated assets were about £19,900. He expressed the opinion that the assets were not valued at a low estimate. The purchase price of the company was £37,500. He understood that the debenture holders intended to sell their property, and this, he thought, was the best thing to do under the circumstances. A resolution authorising the official receiver to continue to act as liquidator was carried unanimously. A committee of inspection was also appointed.

**Obituary.**—The owner of one of the earlier founded English chemical works has passed away in *Richard Bealey*, who died on Tuesday, the 3rd inst. The works at Radcliffe, founded in 1793 as a vitriol works to supply the bleaching croft of the firm with acid, has gradually developed until it is not far behind works of more modern establishment. Glover and Gay Lussac towers were erected in 1871, the Deacon chlorine process in 1873, the Weldon process in 1876, and last year saw the caustic soda manufacture fully established. Bealey's was one of the earliest works in which high-strength bleaching liquor was made. Mr. Adam Bealey, who is or was a physician at Harrogate (Mr. Richard Bealey's brother), having assisted in a very marked degree in putting the manufacture upon a proper scientific basis. In common with several other old-established firms, Mr. Bealey did not join the Alkali Union, although he was often pressed to do so.

## Market Reports.

### TAR AND AMMONIA PRODUCTS.

Benzols are much about the same as last week, the forward position for 50/90's being easier at 1s. 8d. Carbolic acids are very firm and dearer; crude 60% is now quoted 2s. 4d., and 40% crystals 10d. Naphthas are unaltered from last week, either as regards price or position. Anthracene and creosote quiet. Pitch easier at 34s., f.o.b. East Coast.

Sulphate of ammonia is quiet, and prices have been scarcely maintained. The prospective advance in nitrate may strengthen the hands of makers, but the issue is problematical. There would apparently be fair demand at a slight concession in prices, but so far makers refuse to give way any further. Beckton stands at

£8. 7s. 6d., London outside makes £8. 10s., Liverpool and £8. 8s. 9d., and Leith £8. 7s. 6d., spot.

### REPORT ON MANURE MATERIAL.

There has been more enquiry, but actual business done is no factory for the time of year now reached. There is business done in mineral phosphates, but there is no improvement on last prices. In the absence of cargoes offering, there is no business to report in River Plate bones. For crushed East India bones on spot, £4. 10s. ex store, required, but for shipment, £3. 17s. 6d. would be acceptable. After considerable sales of Bombay bone meal at £3. 16s. 3d. on spot and for shipment, the price has been advanced to 17s. 6d. for shipment, and to £4. per ton, ex store, on spot. Crushing bones are worth £3. 12s. 6d. to £3. 15s. per ton, according to quality and condition. Nitrate of soda remains firm. Spot is 8s. for good, up to 8s. 1½d. for refined quality. Due cargo worth about 7s. 11¼d. per cwt, ordinary quality. Home-produced dried blood finds a better sale at 7s. 6d. per unit, f.o.r. at works.

### MISCELLANEOUS CHEMICAL MARKET.

In the alkali trade a fairly steady business is being done in leading products. There are no changes of note during the values all round remain steady. Bleaching powder in fair request at £7. per ton, f.o.r. makers' works, and £7. 5s. per ton, hard f.o.b. For caustic soda current quotations are:—F.o.b. Liverpool 77%, £9. 7s. 6d.; 74%, £8. 10s.; 70%, £7. 10s.; 60%, £6. 10s. per ton, 10-ton lots. Chlorate of potash and soda quiet, and are still sellers at fractions below the nominal quotations of 4½ and 6½d. per lb respectively. Alkali, 58%, steady at £3. 7s. 6d. makers' works. Soda crystals 35s. to 37s. 6d., bags, makers' Saltcake: Some small resales offered at slightly lower rates, but f.o.r. makers' works, is about the general quotation. Sulphur copper has receded a little—sellers at £18. 5s. to £19. per ton according to brand. Brown acetate of lime still in a depression and little business doing even at the low price—spot quoted £4. 10s. to £4. 12s. 6d., c.i.f.; grey £7. to £7. 5s., c.i.f. acid selling at low rates; other acetates without change. It continues good for potash, caustic and carbonate, and there are changes to record in values. Prussiate of potash quiet at 7½d. Cyanide, 97%, 1s. 2½d. In sulphocyanides rather more doing, improvement in prices. For crystal carbolic the market is very firm and price further advanced for 39/40 to 8½d. per lb. Aniline salt are tending lower, owing to slackness of demand and cheap material. White powdered arsenic still continues to advance to 10s. per ton. Oxalic acid 3½d. per lb.

### LIVERPOOL MINERAL MARKET.

The firmness of our market continues to increase. Some of the arrivals being exceedingly scarce, the arrivals being considerably fewer. Manganese: The arrivals this week are very small, whilst the forward both spot and forward is considerably increased, and price firmer. Ground manganese is brisk, at £7., £8., £10., and £12. per ton. Sulphate of manganese, high percentage, £18. 10s. Manganiferous iron ore is brisk, at 1s. to 1s. 6d. per ton. Chrome ore: There have been more arrivals, and prices are steady. Bauxite continues in good demand, but prices are up 20s. for firsts, 16s. for seconds, and 12s. for thirds, f.o.b. chalk: High grades are in good demand, and imports can keep pace with the demand for "Angel White" qualities; prices are firm, at 70s. to 75s., 80s. to 90s., and 100s. to 110s. Wolfram and scheelite are unaltered; stocks are small, and firm. Arsenic continues very scarce, at £20. to £22. per ton. earth is steady, at 50s. for lump, 55s. for ground, and 75s. per impalpable powder, "Emerald," and other brands. Ochre: There has been a good inquiry for good staining quality 60s. to 65s. for ochre and 40s. 9d. for umber. Barytes: Sulphate demand is fair, without change in prices; carbonate, the demand steady, at 65s. for smalls and 80s. for lump, according to quality. Plumbago continues to move freely, foundry and lubricating being done at £6. to £10. per ton, and prime Ceylon at £20. per ton, according to grade. Molybdenite moves. Antifriction ore has been very scarce, and the price has therefore advanced, but a new source of supply has been discovered which brings prices down to their normal level. Pumice stone is in fair demand being done at £6 to £7. per ton, and superior at £7. 10s. per ton. Bog ore: The demand continues at 22s. 6d. to 25s. per ton. Lead ore: The demand for quality is steady, at somewhat better figures.

## THE METAL MARKETS.

NDON, WEDNESDAY.—Pig iron, steady: Scotch warrants at 47s. 5d.; Middlesbrough, 38s. 6d. cash, and hematite, 40s. Copper, unsettled: Chili bars, G. O. B.'s and G. M. B.'s at £44. 15s. to £45 cash, and £45. 2s. 6d. to £45. 7s. 6d. months. Tin, easy: Straits closed at £60. 10s. to £61. and £61. to £61. 10s. three months. Australian, £61. 5s.; Spanish, £11. 1s. 3d.; English, £11. 5s.; Silesian, ordinary, £15. 2s. 6d. to £15. 5s. Nickel, 1s. 2½d. Antimony, Quicksilver: first hands, £7. 2s. 6d.; second hands, 5s. 6d. Copper shares, easy: Cape, 2½ to 2½; Copiapo, 2 to 2¼; a, 3 to 3¼; Mason and Barry, 2½ to 3½; Rio Tinto, 17¼ to 18; Tharsis, 5 to 5¼.

GLASGOW, WEDNESDAY.—Market easier, with good business. Done at 47s. 5½d. cash, also at 47s. 7½d. one month; closing buyers at 47s. 5d. cash, sellers ask 47s. 5½d. Cleveland done at 8½d. one month; closing with buyers at 38s. 6d. cash, sellers 8s. 6½d. Cumberland hematite done at 49s. 1½d. one month; closing with buyers at 48s. 10d. cash, sellers ask 48s. 10½d. Middlesbrough hematite closes with buyers at 46s. 3d. cash, sellers ask 46s.

## LIVERPOOL OIL AND COLOUR MARKET.

WEDNESDAY.

LS.—Palm oil is firmer, but quiet in consequence of buyers being scarce. Lagos has been done at £19. 15s. spot, transit. Olive is steady, and prices for forward are firmer. Syrian is quoted 10s. per tun. Linseed keeps easy, but there is a better demand, Liverpool makes at 20s. 3d. to 21s. per cwt., in export casks, linseed is unaltered, Liverpool refined still standing at 17s. 3d. to 18d. per cwt. Castor oil is steady, good seconds Calcutta being at 2½d. ex quay, and 2½d. store. First pressure French, 2½d. per lb. There is practically nothing doing in tallow, and prices are nominal. Resin meets with a fairly good demand, prices fully maintained. Spirits of turpentine are steady at 21s. 3d. wt. spot. Petroleum is rather firmer, with a better demand. Russian is quoted 6d. to 7½d., and Russian refined 5½d. to 5¾d. gallon.

COLOURS are steady, without alteration in prices. Oxfordshire, common, £10., medium, £12., best, £15. Wexfordshire, common, 40s.; medium, 50s., best, 60s.; Welsh, best, 50s., and common, 18s.; Irish, Devonshire, 40s. to 45s.; French, J.C., 60s. to 65s.; M.C., 65s. to 67s. 6d. Umber: black, 40s.; Devonshire, 50s. to 55s. White lead, £16. Red lead, 10s. Venetian red, £6. to £10. Cobalt: Prepared oxide, 10s.; black, 9s.; blue, 6s. Zaffres: No. 1, 3s. 6d.; No. 2, 2s. Oxide of iron: Common, £7.; medium, £10.; finest, £20. oxide, £22. 10s. to £25.

## TYNE CHEMICAL REPORT.

TUESDAY.

There is practically no alteration to report; business as yet is only moderate. Soda crystals, £2. 2s. 6d. per ton, gross weight, locally. Bleaching powder at £7. to £7. 5s. per ton. Caustic, 76/77%, £9. 5s. in; 70%, £7. 10s. to £7. 15s. per ton. Bleaching powder, softs, £7. 5s. per ton, nett; hards, £7. 10s. per ton, nett; caustic soda, 76/77%, £9. 5s. per ton, nett; do., 70%, £7. 15s. in, nett; recovered sulphur, 2 cwt. bags, £3. 17s. 6d. per ton, nett; ash, 48%, £3. 15s. per ton, nett; do., 52%, £3. 17s. 6d. per ton, nett; do., 56%, £4. per ton, nett; alkali, 36%, £2. 15s. in, nett; white alkali, 48%, £4. 10s. per ton, nett; do., 50%, £5. per ton, nett; do., 52%, £5. per ton, nett; hyposulphite of soda, 5-7 cwt. casks, £6. 5s. per ton, nett; do., 1 cwt. kegs, £7. in, nett; silicate of soda, 75° Tw., £2. 12s. 6d. per ton, nett; 100° Tw., £3. per ton, nett; do., 140° Tw., £3. 7s. 6d. in, nett; soda crystals, casks, £2. 2s. 6d. per ton, nett; weight; do., 2 cwt. bags, £2. 2s. 6d. per ton, nett weight; rate of potash, 5d. per lb., less 6%; pearl hardening, per ton, nett; pure white sulphate of alumina, £3. 17s. 6d. in, nett; blanc fixe, £7. 5s. per ton, nett; chloride of barium, d crystals, £6. 15s., per ton, nett; do., 90/95%, crude calcined, per ton, nett; sulphide of barium, crystals, £4. 15s. per ton, nett; rate of alumina, £30. per ton, nett; aluminate of soda, £30. in, nett.

LT.—South Durham salt is steady at 9s. per ton, f.o.b. Tees.

ALS.—The coal trade is still very quiet, though there is a slightly increased demand for steam. Business is brisk in coke, and, with an increasing consumption, price is firm at 14s. 6d. to 15s. 6d. per ton. Quotations are:—Best Northumbrian steam, 8s. to 8s. 6d.

per ton; second qualities, 7s. to 7s. 6d. per ton; small steam, 3s. 6d. to 3s. 9d. per ton; bunker coals, unscreened, 6s. 3d. to 6s. 9d. per ton; gas coals, 7s. to 7s. 3d. per ton; household coals, 10s. to 10s. 6d. per ton; coke, firm, 14s. 6d. to 15s. 6d. per ton.

## WEST OF SCOTLAND CHEMICALS.

GLASGOW, TUESDAY.

Chemicals generally have been unmoved during the week, with the one exception of sulphate of copper, which has marked a further sharp advance. Alkalies are in slightly improved inquiry for home wants, but the outlook for the spring shipments presents rather a dull appearance for the moment. Sulphate of ammonia makes some faint signs of bestirring itself, and holders here are rather stiffer in their attitude, £8. 10s. being waited for by some of them for Glasgow shipment. Leith prompt, nevertheless, cannot as yet be stated as higher than the old figure, £8. 7s. 6d., and there is still a very large margin for needful recovery. In the mineral oil and paraffin section there is, no change of any unexpected kind, though deliveries are falling off with the season, and neither burning oil nor naphtha are in so much request. The Mineral Oil Association have been meeting frequently, and there are whispers of some new move in preparation—to be shortly announced.

Chief prices current are:—Soda crystals, £2. 2s. 6d., nett, Tyne; soda ash, 48/56°, £3. 15s. to £4. 15s. nett, Tyne; white alkali, 48/52°, £4. 10s. to £5. nett, Tyne; alum in lump, £5 to £5. 5s. nett, Glasgow; caustic soda, white, 74° £8. 10s., 70/72° £7. 10s., 60/62° £6. 10s., and cream 60/62° £6. 7s. 6d., all nett, Liverpool; bleaching powder, £6. 5s. to £7. 5s. nett, Tyne; saltcake, 27s. 6d.; borax, English, refined, £20., and boracic acid, £30. nett, Glasgow; bicarbonate of soda, 5-cwt. casks, £6. 10s., and 1-cwt. casks £6. 15s. nett, Liverpool; bichromate of potash, 4½d. nett, for Scotch and English deliveries (for export, 4½d. nett, f.o.b. Glasgow); bichromate of soda, 3¼d. nett, for Scotch and English deliveries (for export, 3½d. nett, f.o.b. Glasgow); chlorate of potash, 4½d. less 5%, Liverpool; nitrate of soda, 8s. 3d.; sulphate of ammonia, £8. 7s. 6d. prompt, f.o.b. Leith; sal ammoniac, first and second white, £39. and £37. nett, any port; sulphate of copper, £19. 10s., less 5%, Liverpool; paraffin scale, hard, 1½d., and soft, 1½d. to 1½d. per lb.; paraffin wax, 120° semi-refined, 2½d. to 2½d.; paraffin spirit (naphtha), 7½d. per gallon; paraffin oil (burning) No. 1, 6½d., and crystal, 6½d., at works, for Scotch buyers (English sales about ½d. lower); ditto (lubricating) 865° £5., 885° £5. 10s. to £6., and 890/895° £6. to £6. 10s. Week's imports of sugar at Greenock were 24,651 bags beet unrefined.

## HULL PAINT, OIL, AND COLOUR REPORT.

TUESDAY.

OILS.—Prices still have a tendency downward, and the import of linseed during the week has been 13,077 quarters, principally from Rosario. Amongst the principal imports into Hull during the year to date, compared with the same time a year ago, are the following:—Linseed, 98,598 quarters, against 39,027 quarters; rapeseed, 8,508 quarters, against 20,858 quarters; cottonseed, 52,916 tons, against 54,368 tons; olive oil, 4,727 casks, against 1,768 casks; rape oil, 1,019 casks, against 2,771 casks; oilcakes, 4,459 tons, against 3,450 tons; tallow, 6,825 cwt., against 2,327 cwt.; bones, 1,593 tons, against 1,425 tons; turpentine, 6,167 barrels, against 2,980 barrels; guano, 380 tons, against 20 tons. Linseed oil on the spot has declined about 7s. 6d. per ton, 18s. 3d. naked having been accepted, closing, however, with buyers at this rate. Forward positions steady: 18s. 6d. quoted March-April, May-August, or September-December; boiled and refined, £1. to £2. per ton extra. Export for the week, 1,480 cwt. Refined cotton oil remains dull at 15s. 1½d. naked, spot; March-April quoted 15s. 3d., and May-August 15s. 10½d. to 16s. Crude offers at 13s. 9d. naked, spot; casks £1. and ordinary barrels £1. 10s. per ton extra. The export of refined for the week, has been 6,660 cwt. Olive oil from £29. per tun. Spirits of turpentine, £1. 1s. 6d., in barrels. Castor oil remains firm and unchanged. Reports of the yield of cod oil are unsatisfactory. Neutral liquid soap, £14. per ton. Boiled siccative oil, £13. per ton. Locomotive grease, £12. per ton.

CAKES.—Linseed cakes steady: 95% pure, £6. 2s. 6d.; Russians, £5. 17s. 6d. to £6. 2s. 6d.; Americans, £5. to £5. 2s. 6d. Oil cakes, £5. Cotton cakes in quiet demand; market very firm: Best makes, £3. 12s. 6d. to £3. 15s.; seconds, £3. 10s. Rape cakes (Black Sea) firmer; somewhat scarce: Black Sea, £2. 10s. to £2. 12s. 6d.; East India, £3. 10s. to £3. 12s. 6d.

PAINTS continue in good demand, with plenty of inquiries. Prices are:—White and red leads unchanged. Various ordinary colours, in oil, from £11. per ton; paint remover, £1. 5s. to £1. 10s. per cwt.; ready-mixed paints from £24. per ton; imperial black varnish, £5. 10s. per ton, in barrels.

**Potassium Chlorate**—  
Holland, 18 pks. R. W. Greeff & Co.

**Potassium Chloride**—

## ADVERTISEMENT.

### TENDER.

MIRFIELD GAS COMPANY.

Directors are open to receive TENDERS for the AMMONIACAL LIQUOR and Surplus TAR, either together or for Twelve Months from the 1st of April next. The Works per ton, and Ammoniacal Liquor f.o.b. at per oz. strength, Te t. endorsed "Tar" or "Ammoniacal Liquor," not later than Monday, March inst., addressed to  
SAMUEL DAY, Secretary,  
Company's Office, Ravensthorpe,  
March 12, 1896.

## Notices.

Communications for the *Chemical Trade Journal* should be sent to the Editor, and Cheques and Post Office Orders made payable to—

VIS BRCS., 32, Blackfriars Street, MANCHESTER.

Our Registered Telegraphic Address is—

"Expert, Manchester."

NATIONAL TELEPHONE 3060.

Terms of Subscription, commencing at any date, to the *Trade Journal*,—payable in advance,—including postage all over the world, are as follows:—

|                          |          |
|--------------------------|----------|
| Early (52 numbers)       | 12s. 6d. |
| Half-Yearly (26 numbers) | 6s. 6d.  |
| Quarterly (13 numbers)   | 3s. 6d.  |

## Advertisements.

Advertisements of Situations Vacant, Premises on Sale or To be Let, and Specific Articles for Sale by Private Contract are accepted in the *Chemical Trade Journal* at the following rates:—

|                          |                       |
|--------------------------|-----------------------|
| 10 Words and under       | 2s. 6d. per insertion |
| Each additional 10 words | 6s. 6d.               |

Advertisements of Situations Wanted are inserted at one-half the above rates when prepaid, viz.:—

|                          |                       |
|--------------------------|-----------------------|
| 10 Words and under       | 1s. 6d. per insertion |
| Each additional 10 words | 6s. 3d.               |

Advertisements intended for insertion in the current week's issue should be sent to the office by Thursday morning at the latest.

## THERE ARE NONE SO BLIND AS THOSE WHO WILL NOT SEE.

AT last the Chief Officer of the Public Control Department of the London County Council has delivered himself of his conclusions concerning the precautionary measures that ought to be taken to prevent accidents with petroleum oil.

On most points we shall be content to leave this worthy officer and his unworthy recommendations to the tender mercies of the trade. Already the baiting has begun, and it promises good sport so far.

There are, however, one or two points in the Chief Officer's report which come within our province, namely, his remarks concerning the oil as distinct from the lamps. Before proceeding to discuss these points, however, it is unfortunately necessary to refer to the remarks which a contemporary has this week made in connection with this very report and the petroleum accident question in general. Were it not that the statements made are erroneous, we should let the matter pass, as mere expressions of opinion are not worth combating. After a fulsome eulogy on the Chief Officer and his report, we find the following startling pronouncement:—"Yet there is no law to prevent the manufacture in the dwellings of the people of explosives in the form of petroleum lamps which the smallest irregularity in handling or use will convert into agents for spreading death and destruction around them." A truly tasty sentence, which we have carefully refrained from punctuating, so as to preserve all its pristine beauty of expression. But it is not the sentence to which we take exception. Unlike our contemporary, we do not claim to be immaculate, and therefore do not wish to play the rôle of Dictator-general, for we know full well how a hiatus can now and then be passed by the most watchful editor. It is the statement we condemn. Why wonder at the absence of such a law? It would be far more wonderful if a law existed to prevent the manufacture of something that it is impossible to make. A petroleum lamp is to us quite a new kind of explosive. We did not know before that tin, brass and solder, or glass, with perhaps a little plaster of Paris, could either singly or in combination be worked up into a recipe for the manufacture of an explosive. We did know, however, that almost any combination of the above materials in the form of a lamp charged with petroleum (so-called) that flashes at 73°F. would do all our contemporary so graphically describes. In the next sentence we learn that "A short time ago some associated dealers . . . tried to convert this matter of lamp accidents to their own advantage by getting Parliament to raise the flashpoint for lighting oil all round." However such inane twaddle can have crept into the otherwise usually estimable pages of our contemporary we cannot imagine. If at all competent to speak on the matter of lamp accidents the writer must have been aware that for 34

years, ever since the proposed Bill of 1862, the *crux* has been to fix a fairly safe flashpoint. Moreover, the very introduction of the present Abel (or close) test, originated from the Government inquiry about 1870, at which it was decided that the old 100°F. flashpoint (open test) was too low to be safe. There was no mention of lamps. Where does the "short time ago . . . tried to convert this matter of lamp accidents" come in now?

The lamp theory was never heard or thought of until a few years ago. At that time, the low flash party saw that the flashpoint question was becoming unpleasantly prominent, because the public began to realize that the present 73°F. Abel test, was but the exact equivalent of the old 100°F. open test, which years ago had been condemned as too low. Consequently, with truly masterly astuteness, the Standard Oil Company, and their Petroleum Association, suddenly began to find out that it was not a question of dangerous lamp-oils, but dangerous oil-lamps.

Our object in dwelling thus lengthily upon the misrepresentation to which the real aspect of the situation has been subjected is merely to assist in the correct solution of a question of great public interest, and we anticipate with equanimity the wrath which our temerity will probably draw down upon our heads. We are content to deal with facts, and facts only, and to leave sentiment and individual interests to other and more practised advocates.

We can now deal with the officer's report itself. In the first place, the proposals on lamp legislation have already been ably criticised by a leading member of the Midland lamp trade, who states that "serious comment on the proposals is all but impossible . . . for more impracticable schemes could scarcely be propounded." We must confess we cannot see the justice of inflicting such positive and wholesale restrictions upon the lamp-making industry, when the chief objection raised by the Government against the 100° flashpoint is that they *believe* the raising of the standard would hamper the American oil industry.

The report distinctly states that "*raising the flashpoint would effectually prevent accidents if it were practicable.*" Presumably, the supposition of impracticability is based upon the fact that raising the flashpoint "would not prevent the sale and use for illuminating purposes of oil below that flash point," i.e., the point fixed upon, and presumably 100°F. You cannot sell what you have not got, and if no burning oil below 100°F. (Abel) comes into this country, burning oil under 100°F. (Abel) cannot be sold. Naphtha could be, and is sold, but it has to be sold as such. To vend naphtha as burning oil is practising a dangerous fraud. We take it that at present no petroleum inspector would sanction the distribution of oil flashing below the Government standard of 73°F. as petroleum burning oil, and that all oil below that point is subject to the regulations of the Petroleum Act of 1871. We now merely propose to treat all oil under 100°F. (Abel test) in precisely the same way as all oil under 73°F. (Abel) has been treated for years. Wherein lies the impracticability? It seems to us to lie wholly and solely in the fact that the Standard Oil Company do not *want* the change and so "dub" it impracticable. But we are not engaged just now in considering the whims and wishes of millionaires, but the daily safety of millions of British subjects of the middle and poorer classes. The report positively supports the principle of raising the flashpoint and pronounces it to be an effectual preventive of accidents, but doubts its practicability. We should like to know how far the Chief Officer has sought the aid of those who could enlighten him on this point. Not

very far it is certain, for he is still steeped in blissance. But the principle has been admitted to and that is enough. The rest will follow, thing is prepared for the earnest follow this admission. There is just one other lit For a long while the L.C.C. officers have been inquests and bearing witness that no dangerous came into London. In the face of this how is it po this report (which emanates from the same depart admit, even in principle only, that raising the flashp effectually prevent accidents? With these facts s leading members of the lamp-trade in the face, i surprise to us if they submissively allow the L.C.C. such a burdensome yoke upon their necks. If th British manufacturer of to-day is made of very diff to his forbears.

## The Patent List.

*This list is compiled from Official sources in the Technical Laboratory, under the immediate supervision of George E. Davis and Alfred R. Davis, who report upon the value of Chemical Patents.*

### APPLICATIONS FOR ENGLISH LETTERS PATENT

- Improved Colour Grinders. J. Smith and A. Hulse. 4,653. March 1.  
 Manufacture of Alkali Cellulose. C. F. Cross. 4,713. March 1.  
 Filtering, Washing, and Drying Apparatus for Manufacture of Bicarbonate. W. L. Wise. 4,725. March 2.  
 Nitrites of Potash and Soda. L. G. Paul. 4,743. March 3.  
 Cement Manufacture. J. E. Howard. 4,918. March 4.  
 Manufacture of Superphosphates. A. A. and C. J. Yvert. 4,941. March 5.  
 Producing Carburetted Water Gas. W. Wheatley and G. L. March 5.  
 Improvements in Sulphate of Ammonia Saturators. P. Duggan. March 5.  
 Joints for Pipes in Sulphuric Acid Plant. P. Duggan. 5,012. March 5.  
 Enriching Coal Gas. R. G. Shadbolt and J. Wilson, of the firm of and Sons, Ltd. 5,051. March 6.  
 Treatment of Sulphide Ores. T. Parker and J. Pullman. 5,087. March 6.  
 Electrolytic Process and Apparatus therefor. G. B. Baldo. 5,088. March 6.  
 Obtaining Oxygen from Air. L. Chapman. 5,133. March 7.  
 Preparation of Material for Use in Manufacture of Oxygen. L. Chapman. 5,134. March 7.  
 Treating Waste Salt and Apparatus therefor. J. C. W. Stanhewell. 5,165. March 7.  
 Cyanides from Waste Products in Gas, Chemical, and Iron Works. G. P. Lewis and F. S. Cripps. 5,184. March 7.  
 Apparatus for Manufacture of Ozone. M. Otto. 5,195. March 7.

### ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS

*These abstracts are specially prepared for the Chemical Trade, and ALL RIGHTS of publication are RESERVED. This is a series of abstracts of Chemical and allied patents accessible to the public.*

- Improvements in Solidifying Carbon Dioxide and Utilizing the Solidified Substance. H. S. Elworthy, 19, Hill-road, Bandra, Bombay, and P. D. Henderson, 89, Philbeach Gardens, S.W. Eng. Pat. 7,143. 1895.

This patent is essentially a mechanical one, and for particular specification should be consulted. The object is to make of solid carbonic acid or slabs of carbonic acid ice, divided easily broken, each piece being marked with the volume of yield and the size of bottle it will aerate. The gas compressed liquid CO<sub>2</sub> to a coil of pipe immersed in a tank containing ice having non-conducting walls. The alcohol is cooled to a low temperature. Part of the expanded gas is passed to storage vessels and part is used to drive a second gas compressor.

- An Improved Process and Apparatus for the Separation of Acid Gas from the Products of Combustion, or other Mixed Soluble Gases. H. S. Elworthy, 19, Hill-road, Bandra, Bombay, and P. D. Henderson, 89, Philbeach Gardens, S.W. Eng. Pat. 7,281. April 1895.  
 The products of combustion are first passed through an furnace, whereby the monoxide is converted into dioxide, and then passed through a scrubber to remove sulphur dioxide, as by a gas compressor into an absorber. The latter is on muc

## IMPORTS AND EXPORTS FOR FEBRUARY.

THE Board of Trade returns for last month show a satisfactory expansion of trade. In the imports, indigo, cutch, manures, and oilseed cakes show up well. In the exports, with the exception of alkali, most other chemical products show an increase.

## IMPORTS OF FOREIGN AND COLONIAL PRODUCE.

## Official Memoranda.

(From the Board of Trade Journal.)

## THE CAMPHOR TRADE.

In times gone by camphor was produced in Sumatra and Borneo and in other parts of the East Indies, as well as in China; now, however, the crude camphor of commerce is a product of Japan proper and the island of Formosa exclusively.

Great difficulties remain to be surmounted before the Formosa trade can be depended on, for the trees are only found inland, where the inhabitants are aboriginal barbarians, who make matters most unpleasant for explorers.

The Formosa drug is inferior to the Japanese; the latter, by reason of its greater purity, pinkish colour, and bold grain commanding in foreign countries higher prices, by some 2 per cent. or 3 per cent., in spite of its comparative abundance.

The districts in Japan famed for camphor trees are Kiushu, Shikoku, Iga, Suruga, Isé, and Kishiu. The forests owned by the people are almost denuded of timber, and soon very little will be left. However, the Government forests are still very rich in camphor trees, and it has been estimated that this alone will maintain annually, during the next 25 years, the full average supply of crude camphor.

Formerly very little care was bestowed upon the preservation and cultivation of this valuable timber. More recently, however, not only the Government, but also the people have been giving to this most important question the attention it long ago deserved.

The roots contain a much larger proportion of camphor than the trees, 10 lbs. of crude camphor out of 200 lbs. of wood chips being thought satisfactory. The Suruga timber yields a much smaller percentage.

It appears that the only process of extracting camphor from the wood among the mountains in Japan, and the materials used, are of the roughest and most unscientific description. The wood-chips are boiled, the vapour being conducted into a receptacle containing several partitions surrounded by cold water. In the sides of these partitions are apertures, which cause the vapour to fill the divisions by a circuitous route, thus improving the grain of the camphor.

The crude article is brought to market, as a rule, in very rudely constructed wooden tubs.

To make it fit for shipment requires much work, diligence, and perience. Each tub is carefully sampled, vertically and diagonal and the samples are tested by fire and sometimes by alcohol. If solid adulterant is discovered, the condition of the drug is next quired into, the difficulty of this step being best explained by at stating that this crude camphor contains a quantity of water, or oil a water, varying anywhere between 5 per cent. and 20 per cent.

This trouble overcome, the rest is comparatively easy, and consists in weighing, cutting, mixing, and packing for shipment, the packing being in tubs prepared on the premises, partly out of the original packages.

Of course the camphor cannot be packed in its crude condition much of it has to be drained and dried, and frequently a special part of "dry" must be bought, at a very high figure, for mixing with it.

Exports of camphor from Japan appear to have increased in value in proportion to the quantity, during the last ten years, as the following table will show. In this case the value of the yen has been converted at the average rate for the years given, which varies in each case.

## Exports of Camphor from Japan.

| Years. | Quantity. |         | Value. |
|--------|-----------|---------|--------|
|        | Lbs.      | £       |        |
| 1886   | 7,267,000 | 151,000 |        |
| 1887   | 8,637,000 | 179,000 |        |
| 1888   | 6,074,000 | 153,000 |        |
| 1889   | 6,629,000 | 213,000 |        |
| 1890   | 5,952,000 | 314,000 |        |
| 1891   | 5,905,000 | 272,000 |        |
| 1892   | 1,419,000 | 186,000 |        |
| 1893   | 3,317,000 | 167,000 |        |
| 1894   | 2,762,000 | 109,000 |        |

An intelligent and well-directed exploitation of the island of Formosa, where the camphor tree is so abundant, would probably have the effect of lowering prices, by increasing the amount of camphor placed on the market.

The principal countries dealing in camphor are Hong Kong and the United States. The exports from Japan in 1894 were as follow:—

| Countries.           | Quantity. |        | Value. |
|----------------------|-----------|--------|--------|
|                      | Lbs.      | £      |        |
| Australia .....      | 10,600    | 918    |        |
| India.....           | 78,300    | 6,096  |        |
| China.....           | 6,600     | 268    |        |
| France.....          | 4,100     | 302    |        |
| Germany.....         | 13,100    | 7,459  |        |
| United Kingdom.....  | 108,600   | 5,928  |        |
| Hong Kong.....       | 1,654,900 | 87,524 |        |
| United States.....   | 772,500   | 37,464 |        |
| Other countries..... | 2,900     | 162    |        |

Hong Kong is only a transit port where the camphor is refined previous to exportation to Europe.

A special feature of the year 1894 was a material reduction in business in camphor from Japan (as distinguished from camphor from Formosa, now also a part of Japan) in comparison with former years, attributable perhaps to the ever increasing production of Formosa, and the gradual improvement of the quality of the island product.

During the year there was a fraudulent attempt at mixing inferior Formosa camphor with Japanese produce, and passing it off as Japanese camphor. Through the energetic and effective measures which were at once taken by leading camphor exporters, supported by the Japanese Chamber of Commerce, the attempt was discovered at once and such mixtures left the ports.

Another feature of remark was the formation of a guild amongst native sellers, with the declared object of establishing a much-needed reform in quality by introducing certain new and uniform delivery terms, and these have no doubt done away with a great deal of trouble and disputes previously existing.

Mr. N. Perkins, Assistant in Her Majesty's Consular Service, in report on the island of Formosa, dated January 31st, 1895, states that in the north of the island the trade in camphor is rapidly growing in importance; it is, however, attended by considerable risks, as he advances have to be made, and sometimes, whether due to the raid of savages, or other causes, without any return, either in cash or camphor.

New districts are from time to time opened up; the chief at present being Hoonim or Yünlin, Kagee or Chia-I, Chip Chip, Polihsis, Ao-doä-po.

## MINERALS IN SOUTHERN RUSSIA.

The *Revue Commerciale* of Berdiausk, states that vast deposits of iron, graphite, kaolin, and other minerals have been found at the village of Grand Tounak and in German colonies; anthracite has

discovered near Orekhov at the village of Bělitskoŭé. Specimens of kaolin have been already analysed at St. Petersburg, Berlin, and Marseilles; and it has been found that the quality is excellent for the manufacture of porcelain. As for the iron ore, it was said to contain from 62 to 72 per cent. of pure iron, and very little sulphur or phosphorus, in which it resembles the celebrated ore of Krivoi-Rog.

#### PEAT-COAL IN NORWAY.

A specimen of a new fuel, peat-coal, together with report of the inventor, Mr. William Schöning, who claims to have discovered a practical means of converting peat into a cheap and valuable fuel, has been sent to the Foreign Office.

Mr. W. Schöning states that after long continued experiments, he attempted the simplest and most evident manner of pressing the peat, at the same time carbonising it in the press.

In order to test the heating capacity of the new fuel it was analysed by Mr. Schmelck, analyst to the city of Christiania, with the following results:—

|             | Per Cent. |
|-------------|-----------|
| Carbon ..   | 66.15     |
| Hydrogen..  | 6.60      |
| Oxygen ..   | 17.75     |
| Nitrogen .. | 1.86      |
| Sulphur ..  | 0.38      |
| Ashes ..    | 3.76      |
| Moisture .. | 3.50      |

100.00

According to Mr. Schmelck's further analysis it has a firing value of 6,556 degrees of heat per kilog.

The Consul-General at Christiania, commenting upon Mr. W. Schöning's invention, says that if, when thoroughly inquired into and tested, the worth of the various inventions be anything like that which is claimed for them, it seems a pity, in these times of depressed agriculture and vexed land questions, that Great Britain, and especially Ireland, should not participate in the advantages accruing from the utilisation of their peat moors.

#### "SILICATE OF ALUMINIUM."

Mr A. G. Vansittart, her Majesty's Consul at Chicago, reports that a new product has been discovered in the vicinity of Kansas City, Missouri, which is called "silicate of aluminium;" it is a soft stone, and can be cut with a penknife. When placed in cold water for a period of about four hours it expands to about three times its size and becomes a natural paste; this paste is put on horses' feet that have become sore from over-travelling on hard roads, and it seems to have proved a speedy and effective cure in many cities in the United States.

It is said that some foreign countries are now trying it, and that one China house contemplates manufacturing different kinds of goods out of the substance. It has hitherto been used for bunions, sprains, and also for tooth powder, with good results.

The German Government have experimented recently with this "silicate of aluminium" on some of their artillery and cavalry horses that had sore feet, and were so pleased with the result that they have since ordered 20 tons of it to be shipped to Hamburg.

In the event of the above information interesting British houses, inquiries might be addressed to Mr. Philip E. Burrough, British Vice-Consul at Kansas, who will be glad to supply full information on the subject and send samples if necessary.

#### GROWTH OF THE ALUMINIUM INDUSTRY.

THE efficiency of the electro-metallurgical methods now exclusively employed in the production of aluminium is strikingly shown by the figures of the following tabulation, representing the product of the United States since 1882. The first impetus to the industry was given in 1886, when the electric furnace plant of the Cowles Brothers was fairly put in operation. In 1889, when the Pittsburgh Reduction Company entered the field with the Hall electrolytic process, another great advance in output was recorded; and the industry has since been steadily growing year after year.

| Year.      | Pounds. | Year.      | Pounds. |
|------------|---------|------------|---------|
| 1883 ..... | 83      | 1889 ..... | 47,468  |
| 1884 ..... | 150     | 1890 ..... | 61,281  |
| 1885 ..... | 263     | 1891 ..... | 150,050 |
| 1886 ..... | 3,000   | 1892 ..... | 259,885 |
| 1887 ..... | 18,000  | 1893 ..... | 339,629 |
| 1888 ..... | 19,000  | 1894 ..... | 550,000 |

The *Iron Age* estimates the American output of aluminium in 1895 at 850,000 pounds, and believes that the production of the present year will reach the imposing total of 6,000 pounds per day, or over 2,000,000 pounds.

## Our Book Shelf.

**PRACTICAL STUDIES IN FERMENTATION.** By E. C. Hansen, translated by A. K. Miller, and revised by the author. 277 pp., including index. 19 woodcuts. London: E. and F. N. Spon. 1896.

This work provides a full, clear, and practical review of the author's investigations on the cultivation of yeasts. The first two chapters are mainly devoted to a history of the author's work and its relation to the methods of other investigators. The remaining six chapters deal with the practical application of zymotechnic methods to brewing. Chapter five in particular is very interesting, and deals with the question, "What is the pure yeast of Pasteur?" Perhaps the most useful chapter to actual brewers is the sixth, which describes a number of most useful and instructive investigations on the diseases of beer produced by alcoholic ferments. The same class of reader will also be equally interested in the description of the different plant employed in cultivating pure yeast.

The work, which is neatly got up and well printed, is certainly one of the most helpful and suggestive contributions to the study of fermentation in the English language.

**HELPS TO HEALTH AND BEAUTY,** being 200 practical prescriptions by a Pharmaceutical Chemist. 117 pp. London: James Clarke and Co. 1s.

The recipes are conveniently arranged, reference being facilitated by the alphabetically arranged table of contents. The prescriptions are arranged under various headings, such as the hair, hands, face, &c. It is not to be supposed that every good prescription is included in this collection. It may be said, however, that with hardly an exception, there is not a section that does not contain two or three reliable preparations in addition to what may be called stock formulae.

**THE CHEMISTRY OF POTTERY.** By K. Langenbeck. 197 pp. Illustrated. London and Easton, Pa.: Chemical Publishing Co. 1895.

The author has confined himself to relating only what he has arrived at from personal experience. He therefore admits the book must have many shortcomings. From one point of view this may be so, but it ensures the thorough practicability of all that the book contains, a feature of far greater importance than most authors appear to realize. The majority of technical works of this nature consist of a careful and albeit useful compilation of the work of English and foreign investigators, with a small amount of additional information, which is the outcome of the author's direct experience. The value of such books lies mainly in the latter portion. The other is attainable by those who need it, and is not always worth the trouble of collection. Mr. K. Langenbeck has set a good example in confining his remarks to what he is actually acquainted with, and his book is proportionately valuable. He lays, with justice, great stress upon the comparative worthlessness of the majority of clay analyses to the potter, owing to the lack of the necessary additional data concerning physical tests and practical trials. The book from start to finish is as instructive as it is readable. All is good, but the chapters on physical and empirical tests, glazes, stoneware, and burning the ware are among the best.

**MACHINERY AND APPARATUS FOR MANUFACTURING CHEMISTS.** By J. C. Shears. 93 pp. Illustrated. London: E. Marlborough and Co. 1895. 3s. 6d.

This little work belongs to the quasi-catalogue class, which appears to be growing in favour. In other words, it is a readable catalogue of chemical apparatus for manufacturing purposes, the text being enriched by thermometric tables, and handy data concerning the measurement of liquids and the cubic capacity of vessels of varying shapes and dimensions. Attention is paid chiefly to stills, extracting and evaporating pans, macerators, disintegrators, presses, and general, food, fine chemical, and soap manufacturing apparatus, concerning which particulars of the usual sizes and principal advantages, etc., are given. The chapter on steam boilers is likely to be of use to many who have to do with boilers and are nevertheless not qualified to rank as engineers. The book will prove a very handy source of reference to all chemical manufacturers outside the heavy chemical trade, which it does not profess to deal with.

**CATALOGUES AND DIRECTORIES.**—We have received a copy of the *Directory of Papermakers of the United Kingdom (1895)* from Messrs. Marchant, Singer, and Co., 47, St. Mary Axe, E.C. It is conveniently got up, and gives a list of English, Scotch, Irish, Welsh, and Manx papermakers, with particulars of machines and makes. The other

features comprise a list of London representatives of the trade, London wholesale stationers, and a list of mills, arranged alphabetically, numerically, and in counties. Two useful additions are to be found in the classification of makes and trade designations used as water marks. *Messrs. Frederick Jackson and Co., 14, Cross-street, Manchester*, send us a new catalogue and price list of chemical and physical apparatus, and general scientific instruments. It is freely illustrated and indexed, and being strongly bound, is a great advance on the usual forms of *gratis* catalogues. *The Stanton Ironworks Co., Ltd.*, near Nottingham, have recently issued an illustrated descriptive account of Derby and district, with an account of their ironworks, blast furnaces, and collieries at the end. One of the most interesting features is the company's pipe foundry, in which pipes up to 60 inches in diameter are made.

### INDUSTRIAL WATER SUPPLIES.

THERE are a number of trades in which a regular and ample supply of pure water is essential, particularly papermaking and bleaching. The economy of utilizing natural supplies has been shown by facts and figures so often that there is no need to lay further stress on this point, but it will be interesting to many readers to know something of the apparatus by which the water can be pumped at a cost of about 1d. per 1,000 gallons. In Fig. 1 we illustrate one of Mr. T.

Matthews's pumps, which is delivering from 15,000 to 20,000 gallons per hour into a tank on the roof of a paper-mill, and from this tank supplying water to the works by the original system of pipes. The water is obtained from an artesian boring, and as the pump bucket is placed 120ft. below the surface, down into the very source of the spring, the water will have to be pumped down a considerable distance before the supply can fail. As a matter of fact, the whole of the wells in the district would have to run short of water before the one mentioned would reduce its supplies, and no pump for a considerable distance off, which was not at the same depth, could procure water. Full advantage has been taken of this important principle of well-sinking by Mr. Matthews in designing his patent system. The water coming from these depths varies greatly with the nature of the strata from which it flows, a point which manufacturers have to consider in fixing upon the locality in which they intend to settle, especially if the quality of the water is of importance.

The adoption of the above-named principle by Mr. Matthews has enabled him to get almost the theoretical supply of water, and as an instance of this, we may mention that at the works of a large calico printer, in which the best result obtained with other pumps had been 9,000 to 11,000 gallons per hour, the system put in by Mr. Matthews immediately increased the supply to 35,000 gallons per hour. Another special feature in Mr. Matthews' system is that the bucket, clacks, rods, guards, &c., can be lifted direct to the surface without the necessity of any workman going down the well, and in the case above referred to

FIG. 1.

net, &c., can, with all its appendages, be drawn to the surface in a space of two hours, and replaced in the same time, which is a great improvement on the old shaft or well. This system in many cases saves the necessity of costly wells, as the bore is made at the surface and the pump attached direct to the tube. The smaller outputs the pump shown in Fig. 2 will be found of use. It is a pump recently designed for deep bore hole pumping, now working at the Star Paper Mills, Feniscowles, near Black-

FIG. 2.

The illustration being engraved from a photograph of the engine now at the above works. This pump has a bucket about 13 inches in diameter, placed down the bore to the source of supply, and is capable of raising about 30,000 gallons per hour, 24 hours per day. The consumption of steam is small, and the repairs are now, after two years, stated to have been *nil*. The water raised is of the best quality, and costs about five-eighths of a penny per 1,000 gallons.

### ROUGH ON AMERICAN PETROLEUM.

Galician oil has now begun to compete with the American product in Germany. For the first time the export of refined oil from Austria-Hungary to Germany has been made possible by the decline in the price of the Galician crude oil, caused by the increased production in that country. The price of Galician oil was formerly 4 florin (8s. 4d.), but since the opening up of the wells at Schodnica it has fallen below 2 florin. This made it possible to produce refined petroleum at a figure, which allowed it to compete in Germany. In fact, several refineries, especially that at Pilsen, Bohemia, have commenced to compete with the American oil in the German market, and large quantities of refined oil have been exported already to Germany, mostly to Bavaria and Prussia. The Austrian railroads are assisting the refiners in their trade by reducing freight rates. Since November 1st, a reduced freight tariff for refined petroleum and crude benzine

has been in force for the export to Bavaria. The export of crude oil to Germany is impossible at present, because the German import duty is the same on crude as on refined petroleum, namely 6 marks (about 6s.). But as in Germany the desire becomes steadily stronger to supply the home demand by home production, that is refining, and to renounce the American oil, it may be possible that the import duty on crude will be reduced so as to allow the export of Austrian (Galician) crude oil to Germany.

### DEVELOPMENTS IN THE USE OF COAL-GAS.

*To the Editor of the Chemical Trade Journal.*

SIR,—A great change has quite recently come over the coal-gas industry, and this has been so strongly marked during the last 12 months that it appears likely in the near future to become a matter requiring serious attention. It will be well known to many gas engineers that I have for at least 20 years past persistently advocated the use of gas as a fuel for commercial and industrial purposes, and although the effect has been, until recently, very small as compared with the possibilities, the practical result in the aggregate is by no means small. The steady slow growth of this department has recently undergone a most startling change, and industries carried on by manufacturers in the good old style run a serious risk of being left behind in the race by those who have adopted coal-gas for important work, on a scale previously undreamt of. New developments in the form of special burners and furnaces, on a comparatively large scale, have given a sudden and unexpected rise to a steady demand for appliances for innumerable purposes, entailing a gas consumption which a few years ago would have been looked on as incredible. Burners and furnaces of all kinds requiring a gas consumption of from 200 to 1,000 cubic feet per hour for continuous work are now matters of daily demand, and this demand is steadily and rapidly growing. Even now, although the work is new, and to a very large extent special, and therefore costly, the doubt and hesitation of the old times are gone, and manufacturers begin to see that coal-gas for exact work is a necessity at any reasonable price. The daylight and summer service is in many districts growing rapidly, outside the acknowledged one for domestic cooking, and the use of gas on a large scale for manufacturing purposes is growing faster even than my own imagination could have conceived. The manufacture of apparatus of this class is by no means simple at present—in its comparative infancy, and as a matter of profit to the designer and maker it is small as compared with the wholesale production of thousands of burners, &c., of uniform pattern, but it is sufficient to require a special staff, and its growth bids fair to make it a very important industry in a short time. The best point is that once begun, none turn back; on the contrary, fresh developments occur, and the business is now of sufficient importance to make it worth special study and attention. The long expected has come to pass, and rows of furnaces, heated by coal-gas, may now be seen where, until recently, foundry-coke was used; and, what is much more to the point, these furnaces, after experience and after paying the gas bills, are being added to, and larger ones are being built. Bearing on this subject, a paragraph now going the rounds of the Press, referring to some remarks by Herr E. Schweitzer on "the use of gas for singeing fabrics," is worthy of note. The facts as stated by him may now be true on the Continent, and might have been so in England 15 or 20 years ago, but his information is sadly behind the times, so far as this country is concerned. The slit burner described is a relic of the past. I have not seen one in use for at least 10 or 12 years, and those of your readers who are engineers will appreciate the impossibility of retaining the absolute truth of a tube with a slit  $\frac{1}{16}$ -in. wide and of any length from 3 to 15 feet, the burner being subjected whilst in use to excessive changes in temperature. As a matter of fact, these slit burners never remain true, and the work done by them is defective. There is no difficulty in producing burners giving an *absolutely* uniform flame, without break, and of any length. The curious difficulty made by Herr Schweitzer as to starting the web and flame simultaneously has no existence in modern machines; the web travels over a roller carried by two quadrant arms, which are vertical, whilst the burner is being adjusted; the turning down of these arms starts the machine, and places the cloth in the exact position required; no doubt there are antiquated machines in which trouble occurs. The absolute precision and practically unlimited power which can be obtained by the use of coal-gas as a fuel and the ease with which automatic control arrangements can be made, place it in the first rank as a fuel, where precision of results and economy of skilled labour are important, and those employed in industries where these conditions are important are becoming rapidly aware of these facts.—Yours, &c.,

THOMAS FLETCHER, F.C.S.

Warrington, March 11th, 1896.

## DIVULGING TRADE SECRETS.

### IMPORTANT DECISION.

IN the Mayor's Court last week, Messrs. Wake and Sanders, mica merchants, Great St. Helen's, E.C., sued two of their former clerks, Horace and Edward Calhaem, for damages for breach of duty in improperly disclosing the names and addresses of the plaintiffs' customers. They also claimed that any notes or memoranda now in the possession of the defendants and belonging to the plaintiffs should be given up to them, and asked for an injunction restraining the defendants from using the information obtained. It was stated that the defendants had, while in the plaintiffs' service, acquired a knowledge of the mica business, which was carried on by only six firms in London, and had disclosed to another firm the names and addresses of the plaintiffs' customers, and the prices at which the plaintiffs were accepting contracts. With this information the rival firm—which, it was suggested, consisted of the defendants themselves—had, it was said, undercut the plaintiffs in their business, and by sending out slightly lower tenders had obtained contracts which would otherwise have gone to the plaintiffs. A member of the plaintiff firm said that, when taxed with the breach of duty, one of the defendants had practically admitted his guilt. By consent of the parties a verdict was returned for the plaintiffs against each defendant for £10., and an injunction was granted. The plaintiffs estimated their loss over the matter at £250., but they agreed to forego their costs as the defendants were young men just starting in life. The Judge said he thought the plaintiffs had been not only just but generous, and the defendants might have found themselves in a much more serious position, as there was such a crime as conspiracy.

## Trade Notes.

**GOLD PRODUCTION IN THE RAND.**—That the Rand gold mining industry is recovering from the effects of the political troubles is evident from the fact that the February output was 18,840 oz. greater than that of January; but the total of 167,018 oz. is still very poor, and falls short by 2,277 oz. of the production in February, 1895, which was itself disappointingly small. Nothing very great was expected under the existing conditions of short labour supply and a good deal of unrest; but it is at least satisfactory that the rate of production is once again on the increase.

**THE "CUMMER" DRYER.**—We learn from Messrs Chas. Enth and Co., of 70, Gracechurch-street, E.C., that they have received a further order for Crummer dryers amounting to £1,190. from a Belgian firm, the previous order for £1,640. from the same firm having been received last January. The complete plant has been adapted for drying cement slurry within a few hours of its manufacture and in all weathers and seasons. They are also shipping drying apparatus to France, Germany, Spain, and Russia.

**SWANSEA METALLURGICAL INDUSTRY.**—The Mannesmann Tube Works at Landore are extremely busy with orders for tubular telegraph posts for South Africa and India, boiler tubes for the Royal Navy, and bicycle spokes for the States. One American buyer, who was across here a few weeks ago, left an order for about £25,000 worth of the latter. It is not very likely, however, that the American demand will last for long, as works are being erected in the States to carry on the same process of manufacture as at the Landore works. Another new industry which promises to assume large dimensions at Swansea is a new process of dealing with complex ore exported by a London firm. A quantity of stuff is being consigned from Australia for treatment, and 2,000 tons or so have already arrived.

**CHEAP GAS INDEED!**—Amidst the desert of municipal poverty in America there are one or two small cases which deserve attention. One is the city of Lancaster, in Ohio, which owns its natural gas. Nothing could be more reasonable than that the State or the cities should be owners of the natural gas which serves as fuel, lighting, and driving power. Lancaster originally bought the concern from a company, and the management was placed in the hands of three trustees elected by the people for three years. The municipality has now been supplying the citizens with natural gas for seven years at a cost to the consumer less than half that which is charged in other gas towns. The city now owns ten good wells, with a total capacity of 25,000,000 cubic feet of gas per day, of which not more than one eighth is needed, the balance being shut in. The city permits its customers to burn gas without meter at the following charges:—Cooking stoves, one dollar per month; heating stoves, one dollar per month from October to May, and without cost during the summer months. The gas burns day and night in the houses, offices, and stores, keeping the house at an even temperature without the care, labour, or dirt which accompanies the use of coal, and at about half the cost. No fuel but natural gas is used in the city.—*London.*

**ANTHION.**—Under this name a new and powerful oxidiser has been placed upon the market by the *Chemische Fabrik*, &c. It is potassium persulphate, formed by the electrolysis of an solution of the sulphate. The persulphate is precipitated at an anode, and may be separated and purified by re-crystallisation in warm water. It is said to be employed advantageously in dyeing and bleaching, but its greatest utility is found in photography where it is applied successfully for the removal of the last hypo from photographic prints. These residual traces of hypo used in fixing the photographic image, which resist removal by prolonged washing—and which are held to be responsible for the gradual deterioration of photographic prints—are said to be completely removed by the oxidising action of the persulphate.

**RELATION BETWEEN OPACITY AND MOLECULAR WEIGHT.**—Experiments have been made by Mr. H. B. Knowles, Bradford Technical College, and Mr. W. Ackroyd, analysis Corporation of Halifax, which promise to be of high scientific value. They have succeeded in demonstrating, in the case of fifteen prepared chemical compounds, that the opacity of these is in relation to the weight of the molecules of which they are composed. In the investigation, molecules of the same shape were compared—as, for example, oxides of aluminium, chromium, in which there was proved to be a gradual increase of opacity with increased molecular weight. This has been found to be the case with the sulphates of iron, nickel, and cobalt with the oxides of magnesium, zinc, and mercury. The same extends to the metallic elements, in which the transparency to Röntgen rays increases with the lightness of the molecule.

**LUTEOL AS AN INDICATOR.**—Luteol is insoluble in water, soluble in cold alcohol, but readily soluble in hot alcohol and concentrated sulphuric acid dissolves luteol with a red colour, re-precipitated by water. In concentrated hydrochloric acid it is sparingly soluble, but perfectly insoluble in the same acid. Alkalies dissolve it readily with a yellow colour. Luteol expels carbonic acid from the carbonates, and the acid character of the solution is much increased by the introduction of an atom of chlorine. Sensibility of the change of colour is very great. If we add a dilute soda-lye to 1 litre of water, and take 5 to 10 drops of the liquid, it is turned very distinctly yellow. Addition of a few drops of an alcoholic solution of phenolphthalein. Hence its sensitiveness is very decidedly greater than that of phenolphthalein and litmus. As compared with phenolphthalein its advantage of being applicable in presence of ammonia. Its advantage over litmus because no intermediate colours appear on change.

**SIR J. T. BRUNNER ON THE ADVANTAGES OF MASTER TRADE.**—Prizes and certificates were distributed recently to students of the Northwich Science and Art classes by Sir J. Brunner, M.P., who said he was delighted to know that the parents of the elementary schools in the town had recently established a continuation school in order that those who were desirous should continue their education after the ordinary elementary course that they might be the better prepared for the advantage of benefits to be derived from studying under the Technical Instruction Committee. His lengthy experience of business in this country enabled him to assure every boy and girl studying at those schools that there was hardly a trade, from one end of the country to the other, in which there was not a fortune to be made by a man or woman who knew all that there was to be known about it. He regretted that he said it without fear of contradiction, that in a very large measure the trades of this country, whether trades of distribution or of manufacture, were managed by people who knew very little about them. The number of great businesses that were in the hands of men who cared more about fox-hunting, shooting, and fish about their business was very large. If one looked round it seemed as if it were the ambition of well-to-do people in this country to get their children up not to business, but to sport. He could assure a student that there was a great deal of prosperity, an open fortune, to anyone who studied a trade so as to know more than his neighbour.

## Market Reports.

### TAR AND AMMONIA PRODUCTS.

Benzols are firm, 50's being quoted 2s. 2d. to 2s. 3d., and 2s. 1½d. to 2s. 2d. Crude carbolic acid, 60%, keeps steady at 2s. 4½d., but 40% crystals are rather easier at 8½d. Crude is quoted 9d., and solvent, 1s. 6d. Creosote and anthracene without change. Pitch is quiet, at 34s., f.o.b. East Coast.

state of ammonia is very weak, and although there is plenty at very low rates, there is apparently no improvement in the d. Beekton is quoted £8. 5s.; London outside makes: ool and Hull, £8. 7s. 6d.; Leith, £8. 6s. 3d.

### REPORT ON MANURE MATERIAL.

re has been only a moderate inquiry, and there is still a want activity which is looked for at this time of the year. The Kingdom seems still determined to wait in regard to purchasing phosphates, but it is reported that business is doing in high qualities for the continent. Crushed East India bones on spot, per ton, ex store, has been paid, and £3. 17s. 6d. to arrive, the price being the quotation for shipment. Bombay bone meal on spot, and for anything near at hand, has been sold at £3. 16s. 3d. £3. 17s. 6d. per ton, and at the close £4. is required for any on spot, and £3. 17s. 6d. to arrive. Owing to the firmer in East Indian bones and meal, the position of River Plate has somewhat improved, and there would be buyers of any of handy size at £3. 15s.—perhaps at £3. 16s. 3d. Nitrate of fairly steady. Spot value is 8s. for good, up to 8s. 1½d. for quality. Due cargoes are worth about 7s. 11¼d. per cwt., y quality. Home-prepared dried blood finds a better sale at per unit, f.o.r. at works.

### LIVERPOOL MINERAL MARKET.

re has been a very good business done this week. Manganese: arcity continues, and the demand is still very strong, therefore, are very firm and advancing. Ground manganese is in very demand, at from £8. to £15., according to quality. niferous iron ore is in good demand, at advanced prices. e ore: Arrivals are only small, whilst good sales have been and prices are firm. Bauxite is in increased demand, and are firm at 20s. for firsts, 16s. for seconds, and 12s. for thirds, e well-known Irish Hill brand, f.o.b. shipping port. French Arrivals have been only small, and compared with the strong d insignificant, and prices are accordingly strong, at 70s. to 73s., o 90s., and 100s. to 110s. per ton for the "Angel White" es. Wolfram and scheelite are in rather better demand, and are firm. Arsenic continues very scarce, at £21. to £23. per Fuller's earth is steady, at 50s. for lump, 55s. for ground, and per ton for impalpable powder. Ochres and umbers: There en a good business done, at 60s. to 65s. for ochres, and 40s. to or umber. Barytes: Sulphate remains unchanged, and the d for carbonate continues steady, at 65s. for small, and 80s. for Plumbago is in increased demand for foundry and lubricating es, and prices remain from £6. to £10. per ton, and Ceylon from £15. to £20. per ton, according to qualities. Anti- ore is now in very good demand, and commands a good Pumice stone is steady for very fine ground quality, being done to £7. per ton, and superior lump at £7. 10s. per ton. Bog ady, and prices unchanged. There is a steady and increasing d for some of the rarer minerals such as cerite, euxenite, orthite, e, etc, but these of course are very scarce.

### MISCELLANEOUS CHEMICAL MARKET.

he alkali trade there is a fairly steady bulk of business being The tendency has been rather in the direction of lower prices for soda of late. Nearest spot quotations for quantities may be taken as :—F.o.b. Liverpool, 77%, £9. 7s. 6d.; 74%, £8. 7s. 6d.; £7. 7s. 6d.; 60%, £6. 7s. 6d. per ton. Alkali, 58%, remains £3. 7s. 6d., bags, makers' works. Soda crystals unchanged. te of potash, 4¾d. to 4¾d., and chlorate of soda, 6¾d. to 6¾d. For bleaching powder there is a steady enquiry at £7. soft, f.o.r., and £7. 5s. hardwoods, f.o.b. Liverpool. Sulphate of remains in about the same position—sellers at £18. 10s. to £18. o.b. Potash, caustic and carbonate, continue in good demand, ere is no change in values. Cyanide of potassium, 1s. 2½d. prussiate of potash a shade easier, at 7¾d. to 7¾d., according e. Sulphocyanides in fairly good request, and prices unaltered. ate of lime, brown, business is stagnant, at £4. 10s. to £4. 15s. For grey there is rather more enquiry. Other acetates and acid unchanged. For green copperas there is a stronger d, and with lessened output, prices are firmer. Nitrate of soda dged in value. In miscellaneous chemicals the state of business lly is quiet.

### LIVERPOOL OIL AND COLOUR MARKET.

WEDNESDAY.

OILS.—Palm oil is quiet, the business reported being small. Olive is steady, the price for Malaga being £30. per tun, and for Seville £29. to £29. 10s. Linseed has fallen, and is now in moderate demand, with Liverpool refined at 19s. 9d. to 21s. per cwt., in export casks. Cottonseed is cheaper and quiet, even at the reduction: Liverpool refined is quoted 17s. to 17s. 6d. per cwt. Castor oil is steady, though quiet, at 2½d. to 2½d. per lb. for good seconds Calcutta, and 2½d. to 2½d. per lb. for first pressure French. Tallow is dull and featureless. Resin is in very moderate demand, but there is as yet no change in the price of common; medium stands at 5s. 3d. to 6s., and fine 7s. to 7s. 6d. per cwt. Spirits of turpentine are in fairly good demand at 21s. 3d. per cwt. Petroleum is firmer, particularly for refined: American is quoted 6d. to 7½d., and Russian refined 5½d. to 5½d. per gallon.

COLOURS are steady, without alteration in prices. Ochres: Oxfordshire, common, £10., medium, £12., best, £15. Derbyshire, common, 40s.; medium, 50s., best, 60s.; Welsh, best, 90s., seconds, 50s., and common, 18s.; Irish, Devonshire, 40s. to 45s.; French, J.C., 60s. to 65s.; M.C., 65s. to 67s. 6d. Umber: Turkish quiet; Devonshire, 50s. to 55s. White lead, £16. Red lead unchanged. Venetian red, £6. to £10. Cobalt: Prepared oxide, 9s. 9d.; black, 9s.; blue, 6s. Zaffres: No. 1, 3s. 6d.; No. 2, 2s. 6d. Oxide of iron: Common, £7.; medium, £10.; finest, £20. Zinc oxide, £22. 10s. to £25.

### THE METAL MARKETS.

LONDON, WEDNESDAY.—Pig iron, lower: Scotch warrants closed at 47s. 1d.; Middlesbrough, 38s. 6½d. cash, and hematite, 48s. 6d. Copper, steady: Chili bars, G. O. B.'s and G. M. B.'s, closed at £45. to £45. 5s. cash, and £45. 7s. 6d. to £45. 12s. 6d. three months. Tin, firm: Straits closed at £60. 7s. 6d. to £60. 17s. 6d. cash, and £61. to £61. 10s. three months; Australian, £61. 2s. 6d. English ingots, £64. 10s. Lead: Spanish, £10. 18s. 9d. to £11.; English, £11. 2s. 6d.; Silesian spelter, ordinary, £15. 5s. Nickel, 1s. 2½d. Antimony, £30. Quicksilver: first hands, £6. 17s. 6d.; second hands, £6. 17s. Copper shares, steady: Cape, 2½ to 2½; Copiapo, 2½ to 2½; Libiola, 3 to 3¼; Mason and Barry, 2¼ to 3; Rio Tinto, 17¼ to 17¼; Tharsis, 5 to 5¼.

GLASGOW, WEDNESDAY.—Market flat, with moderate business. Scotch done at 47s. 2d., 47s. 1½d., 47s. 2d., and 47s. 1½d. cash, also at 47s. 4d., 47s. 3½d., and 47s. 4d. one month; closing with buyers at 47s. 1d. cash, sellers ask 47s. 1½d. Cleveland done at 38s. 7d. cash; closing with buyers at 38s. 6½d. cash, sellers ask 38s. 7½d. Cumberland hematite done at 48s. 7d. and 48s. 5½d. cash, also at 48s. 8½d. one month; closing with buyers at 48s. 6d. cash, sellers ask 48s. 7d. Middlesbrough hematite closes with buyers at 46s. 1d. cash, sellers ask 46s. 2d.

### WEST OF SCOTLAND CHEMICALS.

GLASGOW, TUESDAY.

In the staples of the chemical manufacture in this quarter, there is a weakening feeling, and the tendency generally is to the fall, although nominally the Union figures are those quoted. Sulphate of copper seems to have expended its upward force, and has already gone back to the extent of a substantial fall. Quotations for bleaching powder are lower by a shade, and saltcake also is quoted at a lower figure. As a set-off, there is the slightly amended position of sulphate of ammonia, which rallied a little towards the close of the week, fetching £8. 10s., f.o.b. Leith, an improvement of half-a-crown on the bottom value marked a week ago. To-day the price is still £8. 10s. In the section of mineral oils and paraffins also the tone forms an exception to the general dullness. Burning oil is helped by the present firmness of the position in American petroleum, and lubricants also are in good demand; while the solids are in fair inquiry at the reduced values lately ruling.

Chief prices current are:—Soda crystals, £2. 2s. 6d., nett, Tyne; soda ash, 48/56°, £3. 15s. to £4. 15s. nett, Tyne; white alkali, 48/52°, £4. 10s. to £5. nett, Tyne; alum in lump, £5 to £5. 5s. nett, Glasgow; caustic soda, white, 74° £8. 10s., 70/72° £7. 10s., 60/62° £6. 10s., and cream 60/62° £6. 7s. 6d., all nett, Liverpool; bleaching powder, £6. 5s. to £7. nett, Tyne; saltcake, 26s. 6d.; borax, English, refined, £20., and boracic acid, £30. nett, Glasgow; bicarbonate of soda, 5-cwt. casks, £6. 10s., and 1-cwt. casks £6. 15s. nett, Liverpool; bichromate of potash, 4¾d. nett, for Scotch and English deliveries (for export, 4¾d. nett, f.o.b. Glasgow); bichromate of soda, 3¾d. nett, for Scotch and English deliveries (for export, 3¾d. nett, f.o.b. Glasgow); chlorate of potash, 4¾d. less 5%, Liverpool; nitrate of soda, 8s. to

Ss. 3d.; sulphate of ammonia, £8. 10s. prompt, f.o.b. Leith; salammioniac, first and second white, £39. and £37. nett, any port; sulphate of copper, £18. 5s., less 5%, Liverpool; paraffin scale, hard, 1½d., and soft, 1¼d. to 1½d. per lb.; paraffin wax, 120° semi-refined, 2½d. to 2¾d.; paraffin spirit (naphtha), 7½d. per gallon; paraffin oil (burning) No. 1, 6½d., and crystal, 6¼d., at works, for Scotch buyers (English sales about ½d. lower); ditto (lubricating) 865° £5., 885° £5. 10s. to £6., and 890/895° £6. to £6. 10s. Week's imports of sugar at Greenock were 2,000 bags beet refined, and 74,706 bags beet unrefined.

## HULL PAINT, OIL, AND COLOUR REPORT.

TUESDAY.

**OILS.**—The markets continued to fall until the early part of this week, when a reaction set in as regards linseed oil, which at the moment is maintained. The import of linseed during the week has not been so heavy as previous, being only 1,997 quarters, making a total for the year of 100,595 quarters, against 52,683 quarters a year ago. Other imports, compared during the same time a year ago, have been:—Cottonseed, 55,410 tons, against 59,667 tons; rapeseed, 12,959 quarters, against 24,743 quarters; olive oil, 5,014 casks, against 1,892 casks; rape oil, 1,126 casks, against 3,098 casks; oilcakes, 4,815 tons, against 3,604 tons; tallow, 7,840 cwt., against 2,791 cwt.; bones, 2,464 tons, against 1,425 tons; turpentine, 6,220 barrels, against 2,981 barrels. Linseed oil has been rather firmer after touching 18s. 3d.; closes firm at 18s. 6d., paid on the spot. For April-August or September-December there are buyers at same price. Boiled and refined, £1. to £2. per ton extra. Export for the week has been 1,260 cwt. Refined cotton oil easier: Spot offers at 15s. naked, and there are sellers at 15s. 1½d. for next month, or 15s. 7½d. May-August; barrels £1. 10s. and ordinary casks £1. per ton extra. Export for the week of refined oil has been 5,680 cwt. Castor oil from 2½d. per lb. for first pressure. Spirits of turpentine, £1. 1s. 3d. per cwt., in barrels. Olive oil, unchanged. Cod oil, £17. to £21. per ton. Boiled siccativ oil, £13. per ton. Neutral liquid soap, for scouring purposes, £14. Locomotive grease, £12. per ton.

**CAKES.**—Linseed cakes firm: 95% pure, £6. 5s.; Russians, £6.; Americans, £5. 5s. Oil cakes, £5. 5s. per ton. Cotton cakes steady: Best makes, £3. 12s. 6d.; seconds, £3. 10s. Rape cakes: Black Sea, £2. 10s.; East India, £3. 10s. per ton.

**PAINTS.**—The paint trade has a very favourable outlook, with a goodly number of inquiries. The prices are:—White lead and oxide of zinc, unchanged; dry venetian red from £4. per ton; ochres from £3. 15s. per ton, in bags or casks; oxide of iron from £6. per ton; ordinary colours, in oil, from £11. per ton; ready-mixed paints, in tins, from £24. per ton; paint remover from £1. 5s. to £1. 10s. per cwt.

## TYNE CHEMICAL REPORT.

TUESDAY.

There is nothing new to report in chemicals on this side. Shipments continue slow, with only a moderate demand. Bleaching powder, £7. 5s. per ton. 76/77% caustic, £9. 5s. per ton; 70%, £7. 10s. per ton. Sulphur still scarce at £3. 17s. 6d. per ton. Soda crystals, £2. 2s. 6d. per ton, gross weight, locally.

Bleaching powder, softs, £7. 5s. per ton, nett; hard, £7. 10s. per ton, nett; caustic soda, 76/77%, £9. 5s. per ton, nett; do., 70%, £7. 10s. per ton, nett; recovered sulphur, 2 cwt. bags, £3. 17s. 6d. per ton, nett; soda ash, 48%, £3. 15s. per ton, nett; do., 52%, £3. 17s. 6d. per

ton, nett; do., 56%, £4. per ton, nett; alkali, 36%, £4. per ton, nett; white alkali, 48%, £4. 10s. per ton, nett; do. £4. 15s. per ton, nett; do., 52%, £5. per ton, nett; hyposulphate, 5-7 cwt. casks, £6. 5s. per ton, nett; do., 1 cwt. ke per ton, nett; silicate of soda, 75° Tw., £2. 12s. 6d. per ton do., 100° Tw., £3. per ton, nett; do., 140° Tw., £3. per ton, nett; soda crystals, casks, £2. 2s. 6d. per gross weight; do., 2 cwt. bags, £2. 2s. 6d. per ton, nett; chlorate of potash, 5d. per lb., less 6%; pearl har £3. per ton, nett; pure white sulphate of alumina, £3. 1 per ton, nett; blanc fixe, £7. 5s. per ton, nett; chloride of refined crystals, £6. 13s., per ton, nett; do., 90/95%, crude £6. per ton, nett; sulphide of barium, crystals, £4. 15s. per ton carbonate of alumina, £30. per ton, nett; aluminate of soda per ton, nett.

**SALT.**—South Durham salt unaltered at 9s. per ton, f.o.b. T.

**COALS.**—Trade here is very quiet, and prices still continue same low level. To-day's prices are:—Best Northumbrian steam to 8s. 3d. per ton; second qualities, 7s. to 7s. 3d. per ton; steam, 3s. 6d. to 3s. 9d. per ton; bunker coals, unscreened, to 6s. 9d. per ton; gas coals, 7s. to 7s. 3d. per ton; household 10s. to 10s. 6d. per ton; coke, very firm, at 15s. per ton.

## New Companies.

**Stapleton and Co., Ltd.**—CAPITAL, £5,000., in £1. share company has been formed to carry on the business of manure manufacturers, barge owners, etc.

**Schnodica Petroleum Co., Ltd.**—CAPITAL, £5,000., in £1. each. This company has been formed to carry on the business of mineral oil refiners, candle, gas, and soap manufacturers.

**Painting and Cleaning Syndicate, Ltd.**—CAPITAL, £25, £1. shares. This company has been formed to sell and deal in colours, oils, varnishes, chemicals, cements, etc. The subscribers memorandum of association are:—H. Satoris, Kettering; F. C. Ingatestone, Essex, gentleman; D. U. Robins, 8, Esmer Bedford Park, W., clerk; H. F. S. Kemlo, 33, Cecil Park, End, gentleman; R. F. Ball, Theydon Copse, Epping, gent; T. G. Faldo, 29, Cambridge-street, Eccleston-square, gentlemen; Phipps, Rushton Hall, Kettering, gentleman.

**Sedgwick Gunpowder Co., Ltd.**—CAPITAL, £30,000., shares. This company has been formed to acquire and carry business of the Sedgwick Gunpowder Co., at Sedgwick, moreland. The subscribers to the memorandum of association J. A. F. Swinglehurst, Sedgwick, near Kendal, manufacturer; J. A. F. Swinglehurst, Sedgwick, near Kendal; J. C. H. Arnside, Westmoreland, merchant; Mrs. J. C. Hamilton, Westmoreland; Miss J. R. Hamilton, Milnthorpe, Westmoreland; Miss M. P. Hamilton, Milnthorpe, Westmoreland; S. Mc Sedgwick, near Kendal, engineer.

**Petroleum Distributing Co., Ltd.**—CAPITAL, £50,000., shares. This company has been formed to supply and distribute petroleum and its products, etc. The subscribers to the memorandum of association are:—C. L. W. Jackson, Normanby Hall, Middlesbrough, gentleman; C. D. W. Cammell, Sheltons Arms, Yorkshire, gen; P. Tzikos, 109, Jermyn-street, S.W., gentleman; A. Suart, Mary Axe, E.C., shipowner; F. C. Sanders, 2, Kenilworth-road, Ford, E., gentleman; W. Pirrie, Leigham Valley-road, Str gentleman; B. Parker, St. Michael's Rectory, Cornhill, solicitor.

## Notices.

All communications for the *Chemical Trade Journal* should be addressed, and Cheques and Post Office Orders made payable to—

**LAYIS BROS., 32, Blackfriars Street, MANCHESTER.**

Our Registered Telegraphic Address is—

**"Expert, Manchester."**

NATIONAL TELEPHONE 3060.

The Terms of Subscription, commencing at any date, to the *Chemical Trade Journal*,—payable in advance,—including postage to any part of the world, are as follows:—

|                                |          |
|--------------------------------|----------|
| Yearly (52 numbers) .....      | 12s. 6d. |
| Half-Yearly (26 numbers) ..... | 6s. 6d.  |
| Quarterly (13 numbers) .....   | 3s. 6d.  |

Readers will oblige by making their remittances for subscriptions by Postal or Post Office Order, crossed and payable to "Davis Bros."

Articles, reports, and correspondence on all matters of interest to the Chemical and allied industries, home and foreign, are solicited. Correspondents should condense their matter as much as possible, write on one side only of the paper, and in all cases give their names and addresses, not necessarily for publication. Sketches should be sent on separate sheets.

Communications for the Editor, if intended for insertion in the current week's issue, should reach the office not later than **Tuesday morning**.

## Advertisements.

Prepaid Advertisements of Situations Vacant, Premises on Sale or To be Let, Miscellaneous Wants, and Specific Articles for Sale by Private Contract are inserted in the *Chemical Trade Journal* at the following rates:—

|                                |                       |
|--------------------------------|-----------------------|
| 20 Words and under .....       | 2s. 6d. per insertion |
| Each additional 10 words ..... | 0s. 6d.               |

Advertisements of Situations Wanted are inserted at one-half the above rates when prepaid, viz.:—

|                                |                       |
|--------------------------------|-----------------------|
| 30 Words and under .....       | 1s. 6d. per insertion |
| Each additional 10 words ..... | 0s. 3d.               |

Advertisements intended for insertion in the current week's issue should reach the office by **Thursday morning** at the latest.

## CURRENT TOPICS.

### THE BRINE PUMPING BILL.

THE discussion of this Bill has recently been advanced by the promoters and opposers before the Select Committee of the House of Lords.

The majority of the evidence was much the same as that given before the House of Commons Committee. The chief opponents were the Salt Union and Messrs. Bowman, Thompson, & Co. Limited. Mr. Balfour Browne stated the case for the Union, but no witnesses were examined.

On behalf of Messrs. Bowman, Thompson, & Co. Limited, however, three witnesses gave evidence. In his evidence for the promoters, Professor Boyd Dawkins gave it as his opinion that pumping operations at Northwich would affect Lostock Gralam. Cross-examined by Mr. Carver, he admitted, however, that he had not investigated the conditions of pumping on Messrs. Bowman, Thompson, & Co.'s land.

After the hearing of the evidence had been concluded, the Committee decided that the Bill should proceed, and on Monday last so reported to the House.

### MARGARINE PENALTIES.

The Food and Drugs Adulteration Committee seem to be getting to work in right earnest. The evidence so far has been largely introductory, so to speak, but is now veering round to the question of penalties.

Our estimate of the adequacy of the present penalties, as deterrents, need not be repeated here, as it has been confirmed and exemplified on many occasions in these columns. The evidence of Mr. Sumner not only supports our contentions, but even goes so far as to advocate the imprisonment of old offenders.

Such a recommendation may smack somewhat of excessively rigorous reform, but such measures are in vogue on the Continent, and truly the experience of the last five years shows that unless it be compulsory for the Bench to imprison after several convictions, it is almost impossible to ensure the severity of treatment that such cases of wilfully-persistent adulteration merit.

Much no doubt could be done by raising the fines in proportion to the number of convictions, but it is absolutely necessary in any change that the present maximum fine of £20. be made the minimum for a first conviction.

The substitution of margarine for butter is such a profitable business that even the maximum penalty of £20., if inflicted once a month, affords but a paltry punishment, and is one that can be almost courted with impunity.

To start at £20. as the lowest fine, however, would put another aspect on the matter, as though, according to our own logic, it would be a bagatelle in the first conviction, the knowledge that the second and third would have to be paid for at about the tune of £50. and £100., would, we feel con-

vinced, cause the vast majority of defaulters to carefully avoid Police Court proceedings altogether.

There is justice also in punishing by imprisonment the act of refusing to sell, without the option of a fine. Already the sale of a sample for analysis is often refused, because it is better to pay the resulting £10. fine and costs than to have the analysis placed on record.

At the same time the very act of refusal is of itself a *prima facie* conviction of fraud, for were it otherwise the analysis would only confirm the honesty of the vendor.

There is, however, one point we should like to see clearly established, and that is that the small retail vendor is fully protected against the ignominy of imprisonment, when the real offenders are wealthy but unscrupulous manufacturers.

It is the latter that must be threatened with imprisonment if they continue to supply margarine or mixtures as butter, but unless the retailers are fully protected by warranties or other means, they will assuredly be made the scapegoats.

#### TWO AND TWO MAKE FOUR.

The display of feeling over Mr. Quilter's Pure Beer Bill is not without its ludicrous side. Pure beer is most desirable, but it is an open question if the methods of the agriculturists will be thoroughly effectual. It is stated on one side that the worst material brewers have to deal with is English barley, and if restrictions are to be placed on the brewing trade, foreign grain will very soon not only partly but absolutely supplant home produce. This is, however, the brewers' statement. On the other hand, though the advocates of pure beer have a most laudable aim in view, their arguments do not always hold water. A very ardent advocate some time ago sent a letter to the Press containing a very lengthy list of "adulterants" used in the making of beer. At first sight the array was formidable, but on closer examination it appeared that, roughly speaking, fifty per cent. of the "adulterants" were calcium sulphate disguised under the various trade names of special water-hardening agents, while the other fifty per cent. were preparations of bisulphites. After this discovery the subsequent phillipics of this well meaning pure beer champion somehow fell flat, and were unconvincing.

The brewers are greatly up in arms, because they allege that the Bill would hamper their trade.

Following their previous policy, the Government should now promptly refuse to hear anything the brewing trade may have to say, on the ground that they are merely seeking their own good.

At the same time, all evidence that may tend to hamper the trade should be accepted with unlimited credulity, so that the importation of foreign beer may increase and multiply plentifully.

It will certainly never do for the Home Office to countenance anything that by any chance may benefit a home industry.

Though foreign beer with an undue proportion of *indicus coculus* may poison a few more people, the matter is of no more importance than the regular roasting to death of one subject a day throughout the year with American petroleum, when contrasted with the heinousness of countenancing the possibility of benefiting a home trade, or giving a just hearing to those who by establishing the magnitude of the danger to the public, might make it impossible for the Home Office to shut their eyes any longer. As far as the brewing interests are concerned, however, we think that if the Home Secretary turned a deaf ear to the prayers of the trade he would have to suffer the tortures of a phonograph advocating in metallic tones the rights of

brewers at his club and even in his bedchamber. Somehow we do not think it will be necessary for brewers to resort to such extreme measures to gain the attention of the Home Office. Truly the ways of Government Offices are mysterious.

#### NOTES ON ARTIFICIAL REFRIGERATION.

THE choice of a gas is not a matter of indifference. First, its critical temperature, that at which the liquid form is not possible, must be sufficiently high, so as not to be attained under the influence of the pressure exerted by the machine. Then, when identical volumes of gas of different natures are reduced by compression to other and smaller volumes, also the same for all, the energy expended, and consequently the pressures and the temperatures attained, will not be the same for the various gases, some of them being heated more highly than others. If they are brought back to their initial temperature with a view to reduce them to a liquid state, a larger quantity of heat must be abstracted from them than from the others; and besides, this quantity will be so much greater as their latent heat of evaporation is greater. By further evaporating they will extract from the surrounding bodies a corresponding quantity of heat, and will therefore constitute a much more intense source of cold.

In other words, to obtain the same quantity of ice, unequal quantities of gas of different nature must be compressed; and this amounts to saying that, for making 50 kilogs. of ice at a temperature of -3 degs. Cent. (26.6 degs. Fahr.) with water at +10 degs. Cent. (50 degs. Fahr.), there must be compressed the following volumes of the different substances:—

|                           | Cubic metres. | Proportion. |
|---------------------------|---------------|-------------|
| Sulphuric ether .....     | 150 .....     | 12.23       |
| Sulphurous anhydride .... | 15 .....      | 2.46        |
| Methylic ether .....      | 10 .....      | 1.52        |
| Ammonia .....             | 5.6 .....     | 1           |
| Carbonic anhydride .....  | 0.97 .....    | 0.174       |

The dimensions of the machines will therefore not be the same. If the volume of the cylinder used to compress ammonia be taken as unity, the various cylinders for the other substances must have the volumes added, at the right of the above table, under the head of "Proportion," from which the favourable position of ammonia will at once be seen.

There are, however, other points in favour of ammonia—its low price, its stability, and the ease with which it may be employed. Indeed, sulphuric and methylic ethers are very inflammable; and sulphurous anhydride bears the reproach of at last absorbing the humidity of the atmosphere, of forming sulphurous acid, and of attacking the machines. There was, however, one circumstance which appeared to render difficult the general use of ammonia machines. Gaseous ammonia, at a temperature equal to that of condensation water, only becomes liquid at a pressure much higher than that necessary for ether and sulphurous anhydride machines, so that it was necessary to make a stuffing-box that should render leakage impossible.

The above figures show that, theoretically, carbonic anhydride machines occupy a still more favourable position than those working with ammonia; but the pressures they require are enormous, attaining 60 to 80 atmospheres. Besides, in addition to the difficulty of special construction, their use sometimes constitutes a permanent source of danger; and, moreover, it is very difficult to detect an escape, as this gas has no smell. Sometimes a mixture of sulphurous and carbonic anhydrides is employed, but comparative trials have pronounced decidedly in favour of ammonia.

**Expansion Machines.**—In this variety a permanent gas, air for instance, is compressed. The work of compression is transformed into heat, and the gas is brought back to its original temperature by cooling down with a stream of water. When the pressure exerted upon it is removed, the gas abstracts from the surrounding bodies exactly the same quantity of heat as that which it has received through the work of compression, and which was afterwards abstracted by the water. It follows that these machines constitute a much less effective source of cold than those of the preceding category, which utilise the relatively high latent heat of vaporisation. To make 50 kilogs. of ice at -3 degs. Cent. with water at +10 degs. Cent., no less than 740 cubic metres of air must be compressed, while 5.6 cubic metres of ammonia are sufficient for the same purpose. If, on the other hand, very low temperatures be required, air-compressing machines better answer the purpose, because, even at a low pressure, the reduction of temperature is considerable.

## The Patent List.

*This list is compiled from Official sources in the Manchester Laboratory, under the immediate supervision of J. Davis and Alfred R. Davis, who report professionally on the value of Chemical Patents.*

### NOTIFICATIONS FOR ENGLISH LETTERS PATENT.

**Composition of Metals.** S. O. Cowper Coles. 5,253. March 9.  
**Apparatus for Manufacture of Formic Aldehyde.** W. Gray. March 9.  
**Means in Treating Low Grade Crude Iron by Bessemer or Gas Process.** L. Pszczolka. 5,358. March 10.  
**Means for Utilizing and Disinfecting Sewage.** P. O'Dowd. 5,381. March 10.  
**Drying Apparatus.** S. M. Lillie. 5,431. March 10.  
**Nitrocellulose Compounds.** O. Nagel. 5,432. March 10.  
**Nitrogenous and other Substances.** J. S. Wallace and J. Evans. 5,495. March 11.  
**Treatment of Carbon in Electro-chemical and other Electro-Processes.** A. Coehn. 5,584. March 12.  
**Electric Process and Apparatus.** A. E. Peyrussion. 5,616. March 12.  
**Treatment and Apparatus therefor.** J. T. Wood and J. A. Brodie. March 13.  
**Means for the Waste Products from Paper Mills.** J. Bradley. 5,665. March 13.  
**Metals by Electrolysis.** A. S. Elnore. 5,673. March 13.  
**Means.** J. N. Spence. 5,705. March 13.

### ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

*Abstracts are specially prepared for the Chemical Trade Journal. All RIGHTS of publication are RESERVED. This is the earliest abstracts of Chemical and allied patents accessible to the public.*

**Means in or Relating to Apparatus for Removing Pitch from Barrels, or the like.** A. J. Boulton, 323, High Holborn, London, E.C. Communicated by C. F. L. Frohberg, Rosswein, Saxony. Eng. Pat. 1,412. 20th, 1895.

The use of fire gases for the removal of pitch from barrels is attended with danger from fire or explosion, and, besides, is a decided nuisance in the neighbourhood. Superheated steam lineary way overcomes the former difficulty, but the trouble and expense remains. The following process aims at obviating both evils:—The superheated steam is introduced by a pipe and a nozzle through the tap hole. The cask is supported on a stand or over a pit, with the bung hole looking downwards. Steam pitch runs out, and is caught in a collecting vessel beneath, steam and vapours are exhausted by a blast-pipe arranged to the closed support or pit. In this way the removal of pitch is effectively and conveniently achieved, while the escaping steam, by contact with the pipe conveying the superheated steam. There are three drawings, which should be consulted for mechanical details of the plant employed.

**Means for Separating Oleaginous Matter from a Solvent.** J. F. Taylor, Whitehall-street, Atlanta, Ga., U.S.A., and A. Riccio, 87, Luckie, Atlanta, Ga. Eng. Pat. 23,159. December 31st, 1895.

A tight vessel connected to a vacuum pump is surrounded by a water jacket, and both are entirely enclosed in a water jacket. The inlet to the vacuum pump is also surrounded with a water jacket, and is connected by pipes to the big water jacket. The vessel when charged with the mixture of oil and solvent (such as naphtha) is exhausted. The naphtha vapour escapes, and is passed by into the surrounding coil, where it is completely condensed. The water of the evaporating and compressing processes cools and water in the big jacket and in the vacuum pipe jacket respectively. The water thus circulates from the one to the other, keeping the naphtha and effecting the complete condensation of the naphtha. The whole of the latter is extracted the oil is run off by a cock at the bottom of the inner vessel. There is one sectional drawing showing the disposition of the supply pipes, and the exhausting and water pipes.

**Improved Process for Making Tormentil Soap by the Cold Process.** Thompson, 31, High Holborn (communicated by J. K. Okie, Berlin, Germany). Eng. Pat. 8,814. May 3rd, 1895.

A soda lye of 40° Bé is run, in a thin stream, into coconut oil at 38°C, in the proportion of 70 parts by weight of lye to 100 parts of oil, the whole being vigorously stirred. The necessary filling is made up, and a perfume made of extract and tincture of tormentil, sandalwood oils, oil of fennel, and oil of violets. The

whole is run into moulds and allowed to stand for about 20 hours, when the saponification is complete. The soap is then removed and allowed to set for half a day, when it can be cut up and pressed into cakes. The addition of colouring matter is not necessary, as the extract of tormentil imparts a bluish brown colour to the soap.

**Improvements in Scouring and Degreasing Wool.** W. G. Heys, 70, Market-street, Manchester (communicated by G. Malard, 19, Rue Cambon, Paris). Eng. Pat. 23,832. December 13th, 1895.

The wool is fed on to a travelling apron or belt which passes above a series of vats containing the cleansing liquid. The latter is pumped up into sprinklers placed above the belt, and so falls on to the wool, and into a device which either returns it to its own tank or into the next. The wool is first treated with liquid rich in wool fat, and finally with pure solvent. The transference of the liquid from tank to tank in the opposite direction to that in which the wool is travelling is accomplished automatically. The invention is essentially a mechanical one, and the six drawings that accompany the specification must be consulted for further particulars.

**Improvement in the Manufacture of Slag Cements.** S. Jørgensen, Strandvej, 14, Copenhagen. Eng. Pat. 9,210. May 9th, 1895.

The chief drawback to cements of this class is the time they take in setting. To overcome this the inventor adds a certain percentage of a specially-prepared cement to the usual mixture of slag and hydrated lime. Thus, 90% of slag and lime with 10% of this "addition" mixture sets in 11 hours, and has a tensile strength of 167 in 7 days. A mixture of 70% slag and lime with 30% of the "addition" mixture sets in 1 hour, and has a strength of 222 in 7 days. The "addition" mixture is made by preparing ordinary slag cement, adding enough water to make it set, which it is allowed to do in a thin, even layer. This layer is then lightly roasted in a kiln, and ground to a very fine powder, which is used for adding to ordinary cements.

## MUNICIPALITIES AND WATER-GAS.

**THE** Edinburgh Gas Commissioners have resolved to accept an estimate for the installation of the plant necessary for the manufacture of carburetted water-gas. This step was taken after consideration of an elaborate report on the question of the dangers and the illuminating and heating power of water-gas, by Professor Crum Brown, Professor of Chemistry at Edinburgh University. It is not intended at first to use carburetted water-gas unmixed, but to employ it, combined with ordinary coal-gas, in the proportion of one to two.

The Birmingham Corporation have also decided to commence the manufacture of water-gas to supplement their present production of coal-gas, which is scarcely adequate to the requirements of the city. It is not proposed to adopt water-gas in a greater proportion than one-third of the total gas production. The plant about to be put down will diminish the amount of coal required to the extent of 8,000 tons per annum, and ultimately to 165,000 tons. The plant to be laid down is of the "Lowe" type, embodying the improvements of Merrifield, Westcott, and Pearson. There are to be two complete sets of generating and carburetting apparatus, with ample condensing, washing, and scrubbing power, also "blowers," exhausters, engines and pumps, oil heaters, &c., each item being in duplicate, and each equal to the working of both sets of generators. At each works the capacity of the plant is to be about two million cubic feet of gas per day. The capital outlay upon the two installations, including buildings and oil tanks now ordered, will be about £60,000, as compared with about £130,000 which would be required upon the most economical lines for coal-gas plant of a corresponding capacity.

**SOUTH AFRICAN SALTPETRE.**—The properties of the South African Saltpetre Fields Co., Ltd., are now in full operation. The first 100 tons will leave in a fortnight. Another rich deposit has been discovered on the company's property.

**CYANIDE PROCESS IN AMERICA.**—The Gold and Silver Extraction Company of America, Limited, has just succeeded in gaining an important legal decision in America in favour of the validity of the MacArthur-Forrest process, and a substantial sum has been recovered for infringement of the patent. It is said that the directors regard this decision with much satisfaction, which is natural, and that they "consider that it is likely to finally settle the question of the validity of the American patents of the MacArthur-Forrest process." It is difficult to see why the word "likely" is used unless we are to assume either that the action was not fought out, or that the decision might possibly be upset on appeal.

## Parliamentary Jottings.

### HORSELESS CARRIAGES.

In the House of Lords on Monday,

Lord Harris, in presenting a Bill to amend the law with respect to locomotives on highways, said the matter was one in which a good deal of interest had been taken during the past year. The method of the Bill was to exempt light locomotives from certain statutory provisions, and then to impose restrictions as regarded weight and traffic. It also reserved certain powers to local authorities and to the Local Government Board. The Bill further contained regulations as to the use and storage of petroleum and other inflammable materials used as fuel. He did not propose to make any further remarks until the second reading. The matter was one in which many of their lordships took a great interest, and it was possible when the measure came on for second reading they might be able to advise him to his advantage.

Lord Cliden asked whether the Bill included electricity as a motive power.

Lord Harris replied in the affirmative.

The Bill was then read a first time.

### THE BRINE PUMPING PROVISIONAL ORDER BILL.

The Brine Pumping (Compensation for Subsidence) Provisional Order Bill passed through Committee, and was reported to the House.

## CRITICISM OF THE PROPOSED LAMP LEGISLATION.

A n able and interesting criticism of Mr. Alfred Spencer's proposals for the regulation of the mineral oil lamp trade, recently appeared in the *Birmingham Post*, the critic being Mr. Edward J. Shaw, president of the Walsall Chamber of Commerce. The article in its entirety is too lengthy to be reproduced in our columns, but the following abstracts contain the pith of Mr. Shaw's arguments:—The legislative measures proposed are to be found in the transactions of the Select Committee held on the 26th and 27th of July, 1894. Mr. Alfred Spencer, of the Public Control Department of the London County Council, appeared as a witness. He advocated "a bill to prohibit the sale of lamps that are not of a safe construction;" he proposed that "the Secretary of State should be empowered from time to time to define what lamps are of safe construction;" that "inspectors should be appointed with power of seizure of dangerous lamps;" and that "the Home Secretary should make it a primary condition that all lamp reservoirs should be of metal." In respect to new lamps Mr. Spencer thought each inventor should "submit his invention to the Home Secretary, who would examine it;" or "the Secretary of State would issue an order which would cover a new invention which he believed to be safe." The chairman of the Committee, Mr. Mundella, asked Mr. Spencer "for any suggestion as to what ought to be done by legislation to secure the safety of lamps." His reply reads: "I should like to have in a clause which I suggest might be embodied in a petroleum bill or any other bill: The Secretary of State may from time to time by order make, and, when made, rescind, and alter specifications of lamps or other appliances intended to be used for burning mineral oil for purposes of illumination, heating, and cooking." Mr. Spencer then included a clause making it unlawful for any person to keep, expose, or sell any lamp not made to the Secretary of State's specifications, and ended by providing the usual penalties. Serious comment on these recommendations is all but impossible; they would excite only amazement were they not dignified by association with a Select Committee, for more impracticable schemes could scarcely be propounded. Suppose we consider, as an example, the one clause giving to the Secretary of State power "to order, to make, and, when made, rescind and alter specifications of lamps," we see, should it become law, that the stock, tools, and machinery of lamp manufacturers would cease to have any stable value. Employers together with employed would be paralysed by the insecurity induced by such an Act. Factors would cease to place orders in advance, not knowing what might happen, and manufacturers would be afraid to buy stocks of material for the same reason. Export demands for lamps and stoves would soon end, and the home trade rapidly become one for capital and labour to carefully avoid. It appears as if Mr. Spencer's suggestions all spring from the belief he expressed, when answering a question of Mr. Mundella's, he said: "Lamp accidents invariably happen because the lamp is made either of improper materials or improperly constructed." Now, as a lamp and glass manufacturer, constantly in touch with retailers throughout the country, I say, emphatically, that accidents do not invariably happen because lamps are defective; they are attributable to a variety of causes, of which this is the least.

A careful collection of the reports of accidents was made by Mr. Shaw through a Press-cutting agency. Concerning these he speaks as

follows:—The reports of accidents furnished me amount to 104. Of these no less than seventeen are avowedly due to assaults or to drunkenness, twenty-five to putting oil in lamps while alight, dropping lamps on the fire, children left with lamps, &c.—in all forty-two so-called "accidents," severe and otherwise, not attributable with any show of reason to the lamps themselves. There now remain sixty-two casualties, which may be classed as follows: Thirty-one described as explosions, twenty cases of knocking over tables, upsetting and stumbling over lamps; and eleven through carrying lamps up and down stairs. I may here observe that the details, as generally given, are meagre, possibly inexact, and the oil used was probably of the lowest grade. In considering what are termed explosions, there is no evidence that these are rightly designated. Explosions are extremely rare. During a long period only three or four have come under my notice, and these were with brass reservoirs filled with cheap oil.

The more such casualties are investigated the more surely will it be seen that about them there is no sensation, no fiery danger beyond control, but only such commonplaces as insobriety, inflammable oil, and unaccountable folly. Whether the reservoirs are of glass or brass, whether burners have short or long wick-tubes, straight or bent, patent or otherwise, these things make little or no difference when confronted with dirt, neglect, and indifference—enemies before which elaborate statutes and assiduous inspectors are equally helpless. [But not safe oil.—ED., C. T. J.]

I now come to the safety, or otherwise, of glass reservoirs, which Mr. Spencer would indiscriminately abolish and replace with metal. Personally, I am in favour of glass, and I use glass, although I make brass reservoirs for others to use. There is, however, glass and glass, and, while I prefer glass when of a proper strength both because of its safety and convenience, I strongly condemn thin glass reservoirs, which break with a slight concussion or fall, and I equally condemn thin metal founts, the seams of which melt when the burner takes fire. Heavy glass reservoirs are in every-day use, and are safe and substantial. I cannot call to mind a single accident in which such reservoirs have been concerned. Their advantages are obvious; they do not cast a shadow like a metal fount, there is no danger of over-filling, the condition of the wick can be always seen, and the oil is kept cool. From a report of a meeting of the Salisbury Guardians, held in December, I take this passage:—"The chairman said that the new small metal hand lamps, which were the cause of so much mischief (fires), had been purchased with the approval of the Poor Law Board inspector, and superseded a set of glass lamps formerly in use, with which no mishap had occurred." I am not opposed to metal founts. Much may be said in their favour, but certainly very far from sufficient to make their exclusive use wise or desirable.

A large portion of the evidence given before the Select Committee relates to what is called the "flash-point" of petroleum, or the temperature at which mineral oils give off an explosive vapour. I am no expert, and this is a question beset with difficulties, for apart from the diverse opinions of professed authorities there is to be considered the powerful influence of the American and Russian Trusts, and the oil trade rivalries as a whole. Amid these forces the lamp manufacturer stands, often as the scapegoat, but animated by a hope that his industry may not be sacrificed to the prosperity of the oil producer.

## BEET SUGAR AND MARGARINE IN BELGIUM.

I n proportion to its population Belgium produces more beetroot sugar than any other European country. In 1893 it possessed an average of one beet-sugar factory for every 51,750 inhabitants, whereas in Germany the proportion was one to every 125,000 inhabitants. The duty on sugar is calculated according to the density and volume of beetroot juice used in its manufacture. But the quantity of sugar extracted over and above the appraisement is unknown, and, as it is certain that the refineries greatly exceed the appraisement, they thus realise a considerable bonus above the internal revenue charge. The product of the refineries is generally a fine sugar of a light brown shade. They also made granulated white sugar for exportation as well as for home consumption, and the export trade is an increasing one. With regard to butter substitutes, it is provided that any person owning a factory for the manufacture of margarine or other artificial butters, or vessels or utensils forming a complete appliance serving to manufacture margarine or other artificial butters, shall make a declaration at the office of the receiver of excise taxes. Owners of manufactories of oleomargarine or melters of suets have to submit to the same formality. All such owners and manufacturers must furnish the agents with means of ascertaining the quantity of raw materials utilised and of product obtained, and must permit them to take the necessary samples; they are also obliged to prove the origin of the raw material. All manufacture of margarine or artificial butter made without declaration is punishable by a fine of £200., and severer penalties are provided for other infractions of the law.

## THE MAGNESITE DEPOSITS OF EUBŒA.

Following information concerning the now well-known Eubœan magnesite deposits in Greece has been communicated from the Foreign Office by Mr. Ernest B. Maxse:—

It has been known for some time that there are large deposits of magnesite ore in Eubœa and in other parts of Greece, as, for instance, in the Peloponnese. The "Société des Travaux Publics et Communaux" has undertaken the working of these deposits and the manufacture of bricks in Eubœa, and to all appearance a new and valuable trade for Greece has been called into existence.

The company is practically the only producer or exporter of stone, and maker of bricks. It owns a number of mines or lodes outcropping high up in the hills some four miles from Krimasi, a small place on the east coast of Eubœa and two miles from Limne, on the west side. At Krimasi vessels lie close in afloat, but the exposed to heavy seas, and affords bad anchorage in November and December. At Limne there is good shelter and nearly always water and excellent anchorage.

Magnesite ore (white stone) is shipped to England and America in sacks, and is sent either crude or calcined. It is also used in the resin in wool-pulp manufacture, and also, I believe, in glass. Apart, however, from these uses I think that by far the most promising field of operation and the most unique is that of using the stone after calcination to 1,600 degrees of heat, and forming it into bricks by machinery, which are then subjected to four days of continuous heat up to 2,150 degrees. This heat is obtained by the combustion of gas obtained from lignite (also a product of the country) by means of Siemens' patent apparatus. These bricks cost 10s. per ton, f.o.b., packed in crates, or about 6d. a piece. A cement to lay them with is made and sold at the same price. Bricks will stand a heat of 2,150 degrees, whereas ordinary fire-bricks which furnaces are built will not stand more than 1,800 degrees at the most. By using these magnesia fire-bricks a greater amount of fuel can be employed and a much more enduring furnace built. Bricks just made with hand-pressed bricks promise that these will be used for backing, or even alone (but, not being so hard, not so advantageous). As they weigh 20 per cent. less they will cost 20 per cent. less than the machine-made ones.

The principal lode worked near Krimasi has been proved to be of 420 metres in length and 20 to 30 metres in thickness (tally). It has been worked in two levels from the top, say, 100 feet, and it probably extends right down through the hill with a tendency to widen out as it goes down. It dips at an angle of about 77 degrees. The other lodes in the immediate neighbourhood, which have been opened up some 50 feet at the outcrop for examination, are similar in appearance.

The lode gives a general average of about 88 per cent. of carbonate of magnesia, one-third of it approximately being inferior. This is ascertained, and the company sells either by degree of analysis or by guarantee. The company only guarantee 95 per cent. of pure magnesia, though the analysis frequently gives 97.80 per cent. The stone is very hard and has to be broken out with dynamite. This magnesite is manufactured near Athens.

Following is the analysis of good quality of stone, such as exhibited at the Chicago Exhibition:—

|                         | Per cent. |
|-------------------------|-----------|
| Silica .....            | 0.45      |
| Oxide of iron .....     | 0.25      |
| Alumina .....           | 1.10      |
| Carbonate of lime ..... | 1.40      |
| „ „ magnesia .....      | 97.80     |
|                         | 100.00    |

In inferior grades the principal increase is in silica, say, to 5 to 7 per cent. This is occurring in the cleavage veins or lines.

P. Négris is the managing director of this company. He is also managing director of one of the large Laurium silver-lead mining companies.

The local manager at Krimasi is Mr. G. Maudias, who superintends the mining, sorting, calcining, and brick-making operations.

A well-engineered and constructed carriage road runs from Limne to Krimasi, near the Krimasi deposits, and on to Achmet Aga, where coal resides, an Englishman owning extensive property in the district.

The surrounding scenery here is lovely—pine-clad mountains to a height of 4,500 feet, and fertile plains at their base cultivated with a large variety of large-grained bearded-wheat.

Limne the mail steamer from and to Laurium calls at least every day both ways. The run takes some 12 hours, including stop at Kalkis, where the steamer has to await the turn of the tide, if it is high, before she can pass through the narrow passage here between Eubœa and the mainland. This channel is not more than 85 fathoms deep, and is in progress of being enlarged. A branch line of rail-

way to the point of the mainland opposite Kalkis is contemplated. This is a portion of the Pireus-Larissa Railway as originally planned. Kalkis (otherwise Chalkis) is the seat of the Nomarch (Préfet) of Eubœa. The telegraph wire runs through Limne to Mautudi, Krimasi, and Achmet Aga, and is carelessly constructed, the line crossing the road at several places so low as to require avoidance by carriages or even foot passengers.

The crude magnesite stone is shipped in large lumps of dazzling whiteness, and as a considerable time elapses between mining and shipping, the 4 to 4.5 per cent. of moisture in it disappears before weighing for shipment, so that practically buyers are said to incur no loss in weight.

A narrow gauge tram-line connects the mines with the brickworks at the foot of the hills, and thence runs some 4 kiloms. to the Krimasi anchorage. I may remark that, owing to the intense heat employed in this brickmaking, the chimney gives out absolutely no smoke.

I regret to report that young children of both sexes are employed in this industry for far too many hours—practically the whole working-day. They are used for carrying bricks and stone and in chipping off the visibly defective portions off the lumps of ore.

## THE ELECTROLYTIC ESTIMATION OF MERCURY.

By EDGAR F. SMITH AND DANIEL L. WALLACE.

THE precipitation of this metal from a cyanide solution has given quantitative results, which render the electrolytic procedure decidedly more advantageous to the analyst than the usual gravimetric course. However, conditions sometimes occur when even the preceding rapid method is made time-consuming. Thus in the working with mercury sulphide it would be necessary to first dissolve the substance in acids and remove the excess of the latter before advancing to the electrolytic decomposition of the resulting salt. Conscious of this fact and that mercury sulphide, as cinnabar, is a natural product, which is quite often offered for analysis, we took occasion to review the method first proposed by Smith, and subsequently confirmed by Vortmann, viz., the electrolytic deposition of mercury from its solution in an alkaline sulphide. The chief point to be ascertained was whether the time factor could be reduced. This had been accomplished with the cyanide solution by simply applying a gentle heat, thereby precipitating two-tenths gram of metal in about two hours. Another point which we wished to definitely establish was the exact current density for a given electrode surface. To this end several determinations were made, using a mercuric chloride solution of known mercury content:—

| Mercury present as chloride. gram. | Mercury found. gram. | N.D. of current in amperes for 100 sq. cm. surface. | Dilution of solution. cc. | Time. hrs. | Temp. °C. |
|------------------------------------|----------------------|-----------------------------------------------------|---------------------------|------------|-----------|
| 0.1913                             | 0.1917               | 0.13                                                | 125                       | 3          | 65°       |
| "                                  | 0.1916               | "                                                   | "                         | "          | "         |
| "                                  | 0.1908               | "                                                   | "                         | "          | "         |

In each case twenty cc. of sodium sulphide of specific gravity 1.22 were present.

These results indicate that mercury can be determined as rapidly and as accurately in this way as when working with a cyanide solution. By means of the method described in Fresenius' Quantitative Analysis, Am. Ed., p. 306, the following results were obtained:—

- 0.9590 gram of mineral gave 0.8194 gram of metal, or 85.44 per cent.
- 0.8586 gram of mineral gave 0.7325 gram of mercury, or 85.31 per cent.

Portions of the same mineral were weighed out in platinum dishes, and after solution in twenty to twenty-five cc. of sodium sulphide of specific gravity previously mentioned, were diluted with water to 125 cc. and electrolysed at a temperature of 70°, with a current of N.D. 100 = 0.12 ampere. The period of time allowed for the precipitations never exceeded three hours. The results were:—

|         | Cinnabar. gram. | Mercury. gram. | Percentage. |
|---------|-----------------|----------------|-------------|
| 1. .... | 0.2167          | 0.1850         | 85.37       |
| 2. .... | 0.2074          | 0.1769         | 85.29       |
| 3. .... | 0.2432          | 0.2077         | 85.40       |

We would observe that during the electrolytic decomposition the platinum dishes should be carefully covered to prevent evaporation, thereby exposing a rim of metal, which, if not in part volatilised, would yet be changed to mercury sulphide. The latter is indicated by a dark-coloured film. With a little attention there should be no question as to the final outcome of any determination made in this way. We regard the method as entirely satisfactory. The short time required for a determination, as outlined above, will recommend it in our judgment to analysts generally.

## THE LIFE WORK OF LIEBIG.\*

BY A. HOWARD.

*Introduction.*—Before commencing this paper I propose to say a few words about the way in which I intend to deal with the work of Liebig. The wide range of subjects over which his work extends makes it desirable to subdivide this brief account of his labours. Firstly, I shall say a few words upon his early life and training. Afterwards I shall give a short account of his work in connection with chemistry, fermentation, agriculture, and physiology. Lastly, I hope to say a few words about Liebig's method of teaching and his influence on the progress of science.

*Early Life and Training, &c.*—Justus Liebig was born on May 12th, 1803, at Darmstadt, where his father dealt in colours.

As a schoolboy Liebig was not a success from the pedagogic point of view. His bent of mind was so distinctly that of the experimenter that, as he tells us, his position at school was very deplorable. Like many other lads of this type, he had no ear memory, and could retain little or nothing of what he learned through the sense of hearing, with the result that he found himself in as uncomfortable a position as a boy could possibly occupy.

Owing to his inclination for chemistry, he was taken by his father to an apothecary at Heppenheim. Here he conducted private experiments in his attic, where before long explosions took place. At the end of a few months the alarmed apothecary was so sorry with his bargain that he sent the lad home again to his father.

Though Liebig had not mastered the lessons of the gymnasium, he had gained a knowledge of most of the processes carried on in his neighbourhood. He had watched the soap boiler, and had made soap on his own account. "In the workshop of the tanner and dyer, the smith and brassfounder, he was at home, and ready to do any hand's turn." Left to himself, he had gained extensive stores of information, and a deep-seated desire for more, and at the age of 16, by persistent importunity, he induced his father to permit him to go to the University of Bonn, whence he afterwards followed his professor, Kastner, to Erlangen. Here, in 1822, at the age of 19, Liebig took his degree of Ph.D., and at the same time published his first paper—an attempt to determine the composition of fulminating mercury.

At this time, Davy in England, Berzelius in Sweden, Gay-Lussac, Dulong, and Arago in France, were opening up new fields of research. These found no soil in Germany, where, as Liebig says, "it was then a wretched time for chemistry." At most of the German universities there was no special chair for chemistry—it was usually handed over to the professor of medicine, who taught it along with his medical subjects. Liebig soon found that he was not in the way to become a chemist at Erlangen, or anywhere else in Germany. His paper on fulminating mercury attracted the attention of the Grand Duke of Hesse-Darmstadt, who furnished him with the means of prosecuting his studies abroad. Then, most of the younger German chemists betook themselves to Stockholm, to sit at the feet of Berzelius. Paris, however, offered Liebig greater inducements. To give an idea of the state of chemistry at this time (1822), I might say in passing that Paris did not then boast of a single public laboratory. In 1823 he met Humboldt (the traveller), who introduced him to Gay-Lussac, in whose laboratory Liebig brought his analyses of the fulminates to a conclusion, and was rewarded by the discovery of *isomerism*.

Speaking of the French lectures, Liebig says:—"What impressed me most in the French lectures was their intrinsic truth, and the careful avoidance of all pretence in the explanations. It was the most complete contrast to the German lectures, in which the whole scientific teaching had lost its solid construction through the preponderance of the deductive method."

It was in Gay-Lussac's laboratory that Liebig, conscious of what he owed to the guidance and friendship of his master, conceived the idea of founding in Germany a school where he should be to his younger fellow workers that which Gay-Lussac had been to himself. A glorious dream gloriously fulfilled!

On Humboldt's recommendation Liebig was appointed in 1824 extraordinary professor of chemistry at Giessen—the university of his country, and the scene of the great labours and triumphs of his life. Two years later he was made ordinary professor. In 1852 he was called to Munich, where he died on April 18th, 1873.

Liebig was essentially a pioneer in science. In the course of his life he took the lead in no less than four great departures:—

1. In organic chemistry.
- 2 and 3. In the applications of chemistry to agriculture and to physiology; and
4. As a teacher.

Among the many distinctions he received may be mentioned the Copley medal of the Royal Society of London.

*Chemical Work:* (a) *Organic Analysis.*—A pioneer in science, like a traveller, must not set out till he is fully equipped. It was useless

for Liebig or anyone else to attempt to explore the depths of organic chemistry before a method for the analysis of organic substances was at his command. This Liebig knew full well, and accordingly we find that his leisure during his first years at Giessen was devoted to contriving such a method.

Lavoisier had attempted to analyse organic compounds, but without success. It was not until Liebig attempted to solve the problem that success was really attained. His method, like that of Lavoisier, consists in completely oxidising the substance under experiment and collecting and weighing the water and carbon dioxide formed. It remains in use almost unchanged to this day; it has served for the analysis of countless numbers of organic substances, and has thus formed the very foundation on which the whole vast structure of modern organic chemistry is based. It may be said to be one of Liebig's greatest gifts to science. Modifications for the process that were suitable for bodies containing *nitrogen*, *sulphur*, and *chlorine* were soon introduced, and thus the fundamental difficulty which had retarded the progress of organic chemistry for nearly fifty years was removed.

*Liebig and Wöhler.*—It would be impossible to tell the story of Liebig and his work without referring to his joint labours with Wöhler. They were guided by similar scientific aims, and were at the same time close personal friends. The portrait of the one is incomplete unless supplemented by the characteristic features of the other. The fruit of their common labour is among the richest in the whole of chemistry.

Wöhler was born near Frankfort on the 31st July, 1800. After taking his degree in 1823 he determined to place himself under the direction of Berzelius, at Stockholm, who was then at the summit of his fame.

After his return to Germany he accepted a post at Berlin, where he isolated aluminium, and accomplished the transformation of ammonium cyanate into urea. During these years he met Liebig. While in Gay-Lussac's Laboratory, in Paris, Liebig examined the fulminates, and satisfied himself as to the composition of fulminic acid. At almost the same time Wöhler was occupied with another and very dissimilar substance—cyanic acid—in the laboratory of Berzelius. Liebig was surprised to find that his results in the case of fulminic acid coincided with the analyses of cyanic acid made and published by Wöhler somewhat earlier. Cyanic acid and fulminic acid were so obviously different that no one could confuse them. Such a result therefore seemed almost absurdly impossible. How could the same elements combine in the same proportions to form dissimilar compounds? It was contrary to the fundamental principles of chemistry. Confident that his own results were correct, Liebig repeated Wöhler's work. But this was correct, too. These two compounds, so different from each other, were indeed identical in their composition. Gay-Lussac accepted the results, and pointed out that the new facts might be accounted for by assuming a difference in the manner in which the constituent elements are combined in the two substances. Before long it became impossible to doubt the existence of the phenomenon of *isomerism* (as it was called by Berzelius), which was first recognised through the work of these two—Liebig and Wöhler. On the very threshold of their careers these two men had made a discovery of the first order. They became friends. Their friendship was soon cemented by their undertaking the joint labours which have inseparably united their names in the annals of science. Fifteen memoirs were published by the two friends. First in importance stands their research on *Oil of bitter almonds*. It was one of the most prolific of their joint investigations. It exercised a most important influence in the growth of chemical theory by establishing in organic chemistry the conception of *compound radicles*. The idea of compound radicles was not absolutely new when Liebig and Wöhler applied it to oil of bitter almonds, for Berzelius had, in 1820, attempted to compare the constitutions of organic substances with those of inorganic compounds by the use of such a conception, whilst it was known from the researches of Gay-Lussac that cyanogen acts very much like an element. But the real development of the existing idea that organic compounds owe their characteristics to the radicles which they contain was mainly brought about by Liebig and Wöhler's memorable research entitled, "Upon the Radicle of Benzoic Acid." In this they proved that in numerous transformations of oil of bitter almonds, and of chlorine and bromine compounds prepared from it, a radicle of the composition  $C_7H_5O$ , which they termed *benzoyl*, remained unaltered. They showed by convincing experiments that this radicle may be assumed as present in benzoic acid, benzoyl, chloride, bromide, and iodide, &c., and that it behaves in these compounds like an element.

|                             |                |
|-----------------------------|----------------|
| Oil of bitter almonds ..... | $C_7H_5O.H$ .  |
| Benzoic acid .....          | $C_7H_5O.OH$ . |
| " chlorine .....            | $C_7H_5O.Cl$ . |
| " bromide .....             | $C_7H_5O.Br$ . |
| " iodide .....              | $C_7H_5O.I$ .  |
| " cyanide .....             | $C_7H_5O.CN$ . |

The joint work of Liebig and Wöhler continued till 1838, when

\* A paper read before the People's Palace Chemical Society, February, 1896.

investigation of uric acid was published. Their experiments showed that this subject is as interesting to the chemist as to the biologist. The readiness with which it takes part in chemical reactions is such that, in a single research, they added no less than 16 instances to the list of organic compounds.

Wöhler foresaw the direction in which organic chemistry was to advance. From their researches on uric acid they said:—The philosophy of chemistry must draw the conclusion that the synthesis of all organic compounds which are not organised must be upon not merely as probable, but as certain of ultimate achievement.

Sugar, salicin, and morphine will be artificially prepared. As we are ignorant of the road by which this end will be reached, since the proximate constituents required for building up these substances are not known to us; but these the progress of science cannot fail to

was the last great research undertaken by these two friends. Soon afterwards turned his attention to agricultural and physiological chemistry, whilst Wöhler thereafter chiefly devoted himself to organic chemistry.

(To be continued.)

## MICROSCOPICAL AND BACTERIOLOGICAL EXAMINATION OF WATER.

By W. P. MASON.

THE PROPOSAL of the recent articles upon this question, which have appeared in the English papers, it is noteworthy that there is a tendency among physicians and civil engineers to belittle the bacteriologist's opinion regarding the potability of a water, and to pin their faith exclusively upon what the bacteriologist may have to say upon the subject. This feeling is strengthened by the publication of the results of such trials as that undertaken by the London Local Government Board, in which it will be remembered water samples purposely contaminated with typhoid germs were sent for analysis to one of the leading chemists and were by him pronounced pure. Those who set special value upon such a test of methods as the bacteriologist and who consider it quite final as showing the inability of the bacteriologist to detect pollution in a liquid which the bacteriologist would pronounce very foul, should remember that such a sample could not be found in practice, and that the very conditions which it was prepared, eliminated the chemical items indicating pollution, while it increased tremendously the signs governing the bacteriological side of the case.

The bacteriologist sought for the Eberth bacillus, and, very naturally, found it in a water purposely sown with a culture of the germ. The chemist looked for those elements which always occur in sewage-water, whether the sewage be from sources of disease or otherwise, not finding them, he pronounced the water to be what it was, free from sewage addition.

Water, as it occurs in practice, contains an immense quantity of material other than that productive of disease, and it is upon just this material, relatively harmless, but constantly present, material that the chemist bases his opinion upon which he bases his opinions.

It is impossible to say whether or not a sewage-laden water is diseased on any particular date, for to him all sewage is alike, but he knows the water, for the reason that, although it may be harmless at the time, it is impossible to predict what may be its condition to-morrow. Recently, I have been requested to make a bacteriological examination of the water of a certain well, in order to determine if it be polluted by neighbouring cesspools.

A physician who made the request was impressed with belief in the great value of such an examination and the comparative uselessness of chemical analysis.

I am quite convinced that, had I followed his suggestion, I should have gained nothing in vain for any specific microbe, but inasmuch as upon a chemical analysis, I found that the "chlorine" ran twenty-four parts per million, which is about ten times the local "normal," and the "nitrogen" read nine parts per million in place of 0.116, I could not have the water off-hand without going further.

There is simply no comparison between the two methods in question for the problems of this class, and the value of chemistry is still more needed in those instances where it is possible to introduce common lithium chloride into a source of suspected pollution, and then an increased chlorine or presence of lithium in the water of the wells in legal cases touching upon this point of contamination of wells, and, for instance, the chemical testimony is especially strong. The matter of determining the suitability of a stream for city water supplies, the services of the bacteriologist should be unquestionably required, but it is doubtful if his report can be considered of more importance than that of the chemist.

In a chemical analysis, by comparing the water taken at the site of the suspected intake with that from the same stream above all points of

possible pollution, can indicate whether or not up stream contamination is felt at the lower point; nor is it necessary that the polluting sewage be from pathogenic sources in order that its presence may be recognised.

As Dr. Dupré has pointed out, chemistry in such cases anticipates what may happen in the future, and, by timely advice, may prevent an outbreak of disease, while, on the other hand, the discovery of disease germs in a water is only possible after the water has become infected.

Bacteriology is of especial value, and greatly superior to chemistry, for the testing of filters and watching any variation in their efficiency.

For this purpose the simple count of germs per c.c. is most valuable, and differentiation is a secondary matter; for the assumption is a just one that a filter which will remove the harmless bacteria, will take out the objectionable ones as well.

It is very far from my desire to decry the value of bacteriology, but I cannot but feel that in their enthusiasm over the great triumphs of the new science, the people at large have gone slightly "bacteria mad," and are apt to expect more than can be furnished by the means and information now available.

## Trade Notes.

**THE CAMEL HAIR BELTING CASE.—VERDICT FOR THE APPELLANTS.**—In the House of Lords, on Thursday, the Lord Chancellor gave his reserved judgment in the case of Reddaway v. Banham. The decision of the Court of Appeal was reversed, and judgment given for Messrs. Reddaway and Co. with costs. The full judgment of the Lord Chancellor and Lord Herschell will be given next week.

**SOCIETY OF CHEMICAL INDUSTRY.—Liverpool Section.**—The annual general meeting of this Section will be held on Wednesday, April 1st, in the Chemical Theatre, University College. The agenda is as follows:—(1) Election of Officers for the Session, 1896-7; (2) Miscellaneous Communications; (3) "A modified Schrötter Apparatus for the estimation of Carbonic Acid." By Dr. C. A. Kohn. (4) "Wood Cellulose manufacture in Scandinavia." By Mr. J. Beveridge. (5) "Calculation of the amount of steam required to dry a ton of paper or pulp." By Mr. J. Beveridge.

**SOCIETY OF CHEMICAL INDUSTRY.—Nottingham Section.**—The sixth meeting of the Session will be held on Wednesday, April 15th, in Room 12, Derby Mechanics' Institution, Wardwick, (next to Free Library), Derby, at 7-30 p.m. Business:—(1) Mr. John White, F.I.C. (County Analyst for Derbyshire), will read a paper on "Filtration and Domestic Filters." He will exhibit specimens of filters. (2) The Chairman will communicate a note on "The Corrosion of Iron by Tar," and exhibit some specimens. This notice is issued earlier than usual to remind members that two very interesting lectures will be delivered in the large theatre at the University College, Nottingham.—On March the 26th at 8 p.m. Professor William Ramsay, F.R.S., will lecture on Argon and Helium (the new gases). On March 31st, at 8 p.m., Professor W. H. Heaton, M.A., will lecture on "The new Photography." The admission will be by *ticket only*, price 2d., obtainable of the Secretary at the College. If to be sent by post a penny stamp must be enclosed. Early application is advisable as the seating accommodation is limited.

## Market Reports.

### TAR AND AMMONIA PRODUCTS.

Benzols are steady: 90's are quoted 2s. 3d. for prompt, 2s. 2d. for three months, and 2s. 1d. to the end of the year; 50/90's are firm at 1s. 8d. Carbolie acids are firm, with 60% crude at 2s. 3d. and 40% crystals at 8½d. Crude naphtha is unaltered at 9d., but solvent is easier, the closing quotation being 1s. 4d. Pitch weak at 33s. 6d. to 34s., f.o.b. East Coast.

Sulphate of ammonia is very feeble. Makers are trying to clear their stocks at any price, and consequently the market is rather upset. Beekton is quoted £8., London outside makes £8. 2s. 6d., Liverpool £8. 3s. 9d. to £8. 5s., Hull £8. 3s. 9d., and Leith £8. 3s. 9d., all prompt. Nitrate of soda quiet, but steady.

### LIVERPOOL OIL AND COLOUR MARKET.

WEDNESDAY.

**OILS.**—Palm oil has fallen in price, and is even now flat at the reduction. Lagos has been sold at £19 10s. for March-April delivery. Olive in but small demand, still prices keep firm, and makers do not seem over anxious to sell. There is no change in linseed, Liverpool makes being quoted 19s. 6d. to 21s. per cwt. in export casks. There is not much doing in cottonseed. Liverpool refined stands at 17s. to

## TYNE CHEMICAL REPORT.

TUESDAY.

a slightly better demand for chemicals, and with the near the Baltic navigation, more business is anticipated. remain unaltered. Soda crystals £2. 2s. 6d. per ton, gross tally. Sulphur £3. 17s. 6d. per ton. Caustic 76/77% £9. 70% £7. 10s. to £7. 15s. per ton. Pig powder, softs, £7. 5s. per ton, nett; hards, £7. 10s. per ton, nett. Soda, 76/77%, £9. 5s. per ton, nett; do., 70%, £7. 15s. per ton; recovered sulphur, 2 cwt. bags, £3. 17s. 6d. per ton, nett; 48%, £3. 15s. per ton, nett; do., 52%, £3. 17s. 6d. per ton, nett; do., 56%, £4. per ton, nett; alkali, 36%, £2. 15s. per ton; white alkali, 48%, £4. 10s. per ton, nett; do., 50%, per ton, nett; do., 52%, £5. per ton, nett; hyposulphite of soda, 2 cwt. casks, £6. 5s. per ton, nett; do., 1 cwt. kegs, £7. 10s. per ton, nett; silicate of soda, 75° Tw., £2. 12s. 6d. per ton, nett; do., 70° Tw., £3. per ton, nett; do., 140° Tw., £3. 7s. 6d. per ton, nett; soda crystals, casks, £2. 2s. 6d. per ton, nett; do., 2 cwt. bags, £2. 2s. 6d. per ton, nett weight; of potash, 5d. per lb., less 6%; pearl hardening, on, nett; pure white sulphate of alumina, £3. 17s. 6d. per ton, nett; blanc fixe, £7. 5s. per ton, nett; chloride of barium, crystals, £6. 15s., per ton, nett; do., 90 95%, crude calcined, on, nett; sulphide of barium, crystals, £4. 15s. per ton, nett; of alumina, £30. per ton, nett; aluminate of soda, £30. per ton, nett.

—South Durham salt steady at 9s. per ton, f.o.b. Tees.

—The demand here is a little fuller, but prices remain unchanged. Bunker coals are rather steadier. Coke is firm, and there is a easing demand both locally and for outside the district. Prices are:—Best Northumbrian steam, 8s. to 8s. 6d. per ton, qualities, 7s. to 7s. 6d. per ton; small steam, 3s. 6d. per ton; bunker coals, unscreened, 6s. 6d. to 6s. 9d. per ton, quiet, 7s. to 7s. 3d. per ton; coke, very firm, at 14s. 6d. per ton.

## L PAINT, OIL, AND COLOUR REPORT.

TUESDAY.

The markets are little changed, with the exception of oil, which is quoted at somewhat lower rates. The imports compared with the same time a year ago, have been:—2,082 quarters, against 101,634 quarters; rapeseed, 12,959 against 25,502 quarters; cottonseed, 55,410 tons, against 15; olive oil, 6,280 casks, against 2,757 casks; rape oil, 5, against 3,247 casks; oilcakes, 5,336 tons, against 4,549 tons, 8,785 cwt., against 3,436 cwt.; bones, 3,264 tons, 171 tons; turpentine, 6,220 barrels, against 2,991 barrels. It has declined 7s. 6d. per ton on the spot, closing with 18s. naked. Forward positions have kept fairly steady: quoted 18s. 3d., and for May-August or September-December buyers at 18s. 4½d. Boiled and refined, £1. to £2. per ton. The export for the week has been 1,240 cwt. Refined remains dull at 15s. naked, spot; April quoted 15s. 1½d.; st. 15s. 7½d. sellers; casks £1. and ordinary barrels per ton extra. The export of refined for the week has been 10 cwt. Olive oil again cheaper, quoted from £26, f.o.b. astor oil from 2½d. to 2¾d. per lb. for first pressure. Turpentine from £1. 1s. 3d. per cwt. Cod oil scarce, £17. per ton. Boiled siccative oil, £13. per ton. Locomotive 2. per ton.

—Linseed cakes remain firm: 95% pure, £6. 2s. 6d.; 55. 17s. 6d.; Americans, £5. 2s. 6d. Oil cakes, £5. to

£5. 2s. 6d. Cotton cakes steady: Best makes, £3. 12s. 6d.; seconds, £3. 10s. Rape cakes: Black Sea, £2. 10s.; East India, £3. 10s.

PAINTS.—The present open weather continues to make manufacturers very busy. The prices are:—White lead and oxide of zinc, unchanged; red lead, £14. 15s. per ton; dry venetian red from £4.; dry ochres from £2. 15s. per ton, in bags or casks; oxide of iron from £6. per ton; black, blue, green, and red colours, in oil, from £11. per ton; ready-mixed paints, in tins, from £24. per ton; paint remover, £1. 5s. to £1. 10s. per cwt.; imperial black varnish, £5 15s. per ton. Oak varnish, 5s. 6d. per gallon.

## New Companies.

**Chemical Glass Works, Ltd.**—CAPITAL, £3,000, in shares of £1 each. This company has been formed to manufacture and deal in chemical and other kinds of glass.

**Thos Worth and Co., Ltd.**—CAPITAL, £20,000, in £10. shares. This company has been formed to acquire and carry on the business of indiarubber manufacturers now carried on by T. Worth and Co., at Edge-lane, Droylsden, and to trade as chemists, drysalters, etc. The subscribers to the memorandum of association are:—T. Worth, Edge-lane Rubber Works, Droylsden, manufacturer; G. Thorn, 66, Cecil-street, Greenheys, Manchester, traveller; J. S. Hulton, 16, Clegg-street, Oldham, accountant; H. Stott, 67, Godson-street, Oldham, accountant; Miss H. Worth, Fairfield-road, Droylsden; J. Prockter, Wallshaw-place, Oldham, draper; A. Greenhalgh, J.P., Radcliffe, bleacher.

**La Frere et Compagnie, Ltd.**—CAPITAL, £10,000, in £5. shares, 600 of which are preference. This company has been formed to carry on the business of chemical manufacturers and agents and blacking manufacturers. The subscribers to the memorandum of association are:—B. Miller, 2, St. Mary's-place, Western-road, Glasgow; W. Miller, 7, Temple-place, Glasgow, housefactor; M. Miller, 2, St. Mary's-place, Western-road, Glasgow, married woman; A. Miller, 2, St. Mary's-place, Western-road, Glasgow, spinster; M. H. Miller, 2, St. Mary's-place, Western-road, Glasgow, spinster; H. J. Miller, 2, St. Mary's-place, Western-road, Glasgow, manufacturing chemist; B. D. Miller, 47, Oswald street, Glasgow, manufacturing chemist.

## Gazette Notices.

## PARTNERSHIPS DISSOLVED.

S. SYMINGTON and J. SMITH, under the style of the Gallow Hill Co., Market Harborough, glue, manure, and chemical manufacturers.

J. BOOTH and G. H. OPENSHAW, under the style of Booth and Openshaw, Black burn, drysalters and oil merchants, etc.

WRIGHT, RUDMAN, and Co., Ashton-under-Lyne, chemical manufacturers.

## BANKRUPTCY ACTS, 1883 and 1890.

## Receiving Orders.

BATEMAN, JOHN, Knaresboro', Lower Tooting, late Stamford-street, Blackfriars S.E., traveller, late oil and waste dealer.

HARNAMAN, J. T., Birmingham, drysalter and oil and colour merchant.

MEYER, SPAULL, and SCHLENGEMANN, St. Mary Axe, E.C., chemical and Australian merchants.

## Adjudication.

MILNES, TOMMY (trading as John Milnes and Sons), Brighouse, carrier and partner in the firm of Savory and Co., Calder Chemical Works, Brighouse, drysalters.

## IMPORTS OF CHEMICAL PRODUCTS

AT

## THE PRINCIPAL PORTS OF THE UNITED KINGDOM.

## LONDON.

ending March 14th.

## LATE ADVERTISEMENTS.

### TENDER.

COUNTY BOROUGH OF BURY.

TO SULPHURIC ACID MAKERS.

THE Gas Committee of the Bury Corporation are prepared to receive TENDERS for the supply of about 350 tons of Sulphuric Acid for the Manufacture of Sulphate of Ammonia, for a period of One Year, from 1st May, 1896.

Forms of Tender and conditions may be obtained on application to Mr. W. H. S. GERRARD, Engineer and Manager, Gas Works, Elton, Bury. Sealed Tenders, endorsed "Tender for Acid," to be sent to me, the undersigned, on or before Monday, April 20, 1896. Preference will be given to those persons or firms who pay to their workpeople the regular standard rate of wages obtaining at the time in the town or district.

JOHN HASLAM, Town Clerk.

Corporation Offices, Bury, April 1, 1896.

**CHEMICAL WORKS**—Wanted, by elderly Person, who has had many years experience in Sulphuric, Nitric, and other Acids. Situation in same; satisfactory references.—Address "Acids," *Chemical Trade Journal* Office, Manchester.

## Notices.

All communications for the *Chemical Trade Journal* should be addressed, and Cheques and Post Office Orders made payable to—

**DAVIS BROS., 32, Blackfriars Street, MANCHESTER.**

Our Registered Telegraphic Address is—

"Expert, Manchester."

NATIONAL TELEPHONE 3060.

The Terms of Subscription, commencing at any date, to the *Chemical Trade Journal*,—payable in advance,—including postage to any part of the world, are as follows:—

Yearly (52 numbers) ..... 12s. 6d.

Half-Yearly (26 numbers) ..... 6s. 6d.

Quarterly (13 numbers) ..... 3s. 6d.

## Advertisements.

Prepaid Advertisements of Situations Vacant, Premises on Sale or To be Let Miscellaneous Wants, and Specific Articles for Sale by Private Contract are inserted in the *Chemical Trade Journal* at the following rates:—

10 Words and under ..... 2s. 6d. per insertion

Each additional 10 words ..... 6s. 6d.

Advertisements of Situations Wanted are inserted at one-half the above rates when prepaid, viz.:—

10 Words and under ..... 1s. 6d. per insertion.

Each additional 10 words ..... 6s. 3d.

## CURRENT TOPICS.

### THE PROGRESS OF RIVER PURIFICATION.

THIS week an interesting report of the work done by the Mersey and Irwell Joint Committee has been made public. On the whole the figures given in this report show a substantial advance upon last year even, and a very marked alteration since the day the Committee first began its labours.

A consideration of the report on broad lines would seem to indicate that the only unsatisfactory progress that has been made has been with local authorities. Manufacturers on all sides are shown by the report to have done more to stop pollution, at great personal expense, than any of the other polluters. This fact was also directly testified by the chairman in his remarks on the report.

Such a state of affairs is as pleasing as it is commendable, and only further emphasises the truth of our contention that ever since the formation of the Committee there has been a tendency to attach too much importance to the enormity of manufacturers' pollution in comparison with that from inefficiently treated sewage. From the present report we now see that had local and sanitary authorities met the Committee as fairly and honestly in their endeavours as it is proved manufacturers have, the rivers instead of showing an improvement that needs some looking for, would have been obviously and manifestly purer. No doubt now the extreme importance of using exceptional pressure to force on the work of authorities will be recognised and acted upon by the Committee. Much of the loss of time is undoubtedly due to the fact that authorities, unlike manufacturers, have practically no personality, and therefore cannot be coerced to the same extent.

When the business before the Committee was concluded Sir Henry Roscoe was called in and advised that he had been reappointed at an inclusive salary of £725. for the ensuing year. As this decision was the outcome of the investigation by the General Purposes Committee of the questions specially referred back to them, we presume the members of that Committee succeeded in fully satisfying themselves that the services of Sir Henry and his lieutenant had been entirely devoted to the furtherance of the Committee's work, and not divided between the latter and those the Committee had to supervise. At the same time it would appear that this same Committee was equally convinced that the special services that entailed the extra £100. had been specially serviceable. In thanking the Committee, Sir Henry "expressed a hope that he would be able to be of some assistance in the future"—a hope in which we fervently join.

### THE METRIC SYSTEM.

Progress is steadily being made towards the attainment of the ultimate introduction of this system of weights and measures.

The recommendations of the Parliamentary Committee were perhaps somewhat too drastic, as there is nothing goes so much against the grain of the British public as an attempt to enforce changes by compulsion, instead of suasion.

To make an entire change compulsory at the end of two years might, and most likely would, have entailed the infliction of hardships on many for the benefit of the few; but the introduction of compulsory measures could with advantage be made in connection with the teaching of the system in all schools. In this way the growth of its use would be ensured, in the future. In addition to this, it probably would be advisable to make provision for its general adoption becoming compulsory when it has of itself, and on the strength of its own merits, become universal in a definite percentage of industries.

It appears that the Board of Trade are formulating a Bill which is intended to place the metrical commercial system on a practical basis. The precise lines of the measure are at present imperfectly known, but we are informed that it will be introduced into Parliament next session.

#### ANTITOXIN.

As is generally the case, after the first flush of excitement and novelty, a new discovery is soon dropped and forgotten by the public.

In the scientific world, however, although there is a great deal of caution exercised in accepting any new idea or process, still, if it can show a fair claim to success, an honest test of its capabilities can usually be relied upon.

Thus, in spite of the fact that little has been heard of antitoxin of late, a careful investigation of its efficacy as a preventive of diphtheria has been in progress for more than 12 months in the hospitals of the Metropolitan Asylums Board.

According to the opinions of the medical superintendents at these hospitals, the investigations have sufficiently demonstrated the value of the antitoxin treatment. The conclusion to be drawn from a general survey of the results, is that in 1895 some 250 lives were saved by the use of antitoxin in London alone.

The estimate of efficiency is based upon a contrast of the percentage mortality during the ten months of 1894 (preceeding the introduction of antitoxin), and the whole twelve months of 1895. For the year 1894 the percentage was 29.6, the lowest ever recorded up to that time. Last year, however, the percentage fell to 22.5, a reduction of 7.1 per cent., although the average severity of the disease in the two years was as near equal as can be, and the percentage of juvenile cases (which are usually less favourable) was rather higher than in 1894. Lastly, additional confirmation is to be found in the fact that those individual hospitals which made the least use of antitoxin show the highest rate of mortality. The report also deals at length with the after effects, but adduces nothing that materially affects the reliability of the deductions that must obviously be made from the foregoing particulars.

THE CRAIG OIL COMPANY NOT SUNK IN THE STANDARD.—Quite recently it was definitely stated that this Company had sold out to the well-known—too well-known Standard Oil Co. As a matter of fact, this statement is wholly erroneous as no such sale has been made. Moreover, no transfer to the Standard was ever contemplated by the firm mentioned. The Craig Oil Company further states that such rumours have been detrimental to its business, and means are to be taken to prevent their circulation in the future. The company is still conducting its business independently of the Standard, and it is the intention to continue to do so. In the face of this it is hardly likely that the paragraph reporting the sale could have emanated from the Craig Oil Company. If it was induced by the Standard, no doubt the wish was father to the thought.

## Legal Intelligence.

### HOUSE OF LORDS.

(Before the Lord Chancellor, Lord Herschell, Lord Macnaghten, Lord Morris, and Lord Shand.)

FRANK REDDAWAY AND F. REDDAWAY AND CO., LIMITED  
GEORGE BANHAM AND GEORGE BANHAM AND CO., LIMITED

This was an appeal from a decision of the Court of Appeal in a judgment of Mr. Justice Collins delivered at the trial in May with a jury in an action brought by the appellants against respondents for an injunction to restrain the latter from using the word "camel" in such a manner as to deceive purchasers into the belief that they were purchasing goods of the appellants' manufacture from passing off their goods as and for goods of the appellants' manufacture. According to the case of the appellants, the appellants Reddaway had been for many years a manufacturer of machine belts, and in October, 1892, he converted his business into a limited company under the title of F. Reddaway and Co., Limited, who were the appellants.

The case was argued some weeks ago when judgment was reserved. Their lordships delivered judgment on Thursday, 26th ult., reversing the decision of the Court of Appeal.

The Lord Chancellor: I believe in this case that the question is upon a question of fact. The question of law is so constantly raised with the various questions of fact which arise on an inquiry into the character in which your lordships have been engaged that it is sometimes difficult when examining former decisions to disentangle what is decided as fact and what is laid down as a principle of law. I myself believe the principle of law may be very plainly stated, that is that nobody has any right to represent his goods as the goods of somebody else. How far the use of particular words, signs, or marks does or does not come up to the proposition which I have enunciated in each particular case must always be a question of evidence, and the more simple the phraseology the more like a mere description of the article sold comes to be nearer to or far from a representation of the goods of the rival manufacturer the greater becomes the difficulty of proof, but if the proof establishes the fact the legal consequences appear to follow. In this case the words "camel-hair belting" suggests such a difficulty of proof. If I had been sitting as a judge in this case I confess, but for a circumstance I am about to mention, I should have had great difficulty in acquiescing in the contention that a person was making his goods pass as the goods of somebody else simply describing the subject of sale by these words. It is part of the trade or substantially made of camel hair, and it is belting. To other persons not familiar with the trade this undoubtedly does not simply a description of the article sold, and not a representation of its being made by a particular manufacturer. But then I should know what persons engaged in the trade would know by particular words, even though descriptive of the article sold, had acquired a kind of technical signification which would give to the words the trade as completely the character of being made by a particular manufacturer as if they were stamped with his trade mark. The circumstance to which I referred is to be found in the letter of July 1891. The writer, who doubtless knew what he was doing, desired that the thing which he is ordering should bear no other name than "camel-hair belting," and if he gets that he adds, "I think take this order from Reddaway's." I think with this letter the jury were perfectly right, and that my *prima facie* impression from the words being only descriptive of the article sold would have been wrong. The result is in my mind that the proof is satisfactory and that one man's goods are being sold as if they were the goods of another. Reliance appears to have been placed in the Court of Appeal on what was supposed to be decided in *Burgess v. Burgess* (3 De G. M. and G., 896) by Lord Justice Knight Bruce and George Turner, and I think it is necessary to examine the decision in *Burgess v. Burgess* to see what it really did decide, and upon which that decision was based. The Vice-Chancellor Knight Bruce had by an injunction restrained the defendant from continuing the words "late of 107, Strand," where he had been employed as a father, and from continuing on the sides of his shop door a placard the words, "Burgess's fish sauce warehouse, late of 107, Strand." The defendant Burgess had for many years been in the employ of his father in the trade of an Italian and fish sauce warehouseman, had, shortly before the application for the injunction, set up, in William-street a similar business, placing the words which the Vice-Chancellor restrained the use of on his shop door and the side of his house. An appeal was brought against the refusal of the Vice-Chancellor to go further and to prohibit the use of the words "Burgess's essence of anchovies" in any bill-head, invoice, or advertisement. The refusal of Lord Justice Knight Bruce to interfere with what the Vice-Chancellor had determined is stated by his

be grounded on the fact that the defendant carried on business under his own name, "sells his essence of anchovies, which appears to be assumed to be a known article, as Burgess's essence of anchovies, which in truth it is." "The whole ground of complaint," says Lord Justice Knight Bruce, "is the great celebrity which, during many years, has been possessed by the elder Mr. Burgess's essence of anchovies," again, he it observed, treating the words "essence of anchovies" as describing a known article not peculiar to any one manufacturer. "That," continues the learned judge, "does not give him such exclusive right, such a monopoly, such a privilege, as to prevent any man from making essence of anchovies, and selling it under his own name." And Lord Justice Turner, I think, most accurately says—"It is a question of evidence in each case whether there is false representation or not. Looking at the labels before us, I think it is clear that, since the order made by the Vice-Chancellor, there has been no representation made on the part of the defendant that the goods which he is selling are the goods manufactured by the plaintiff." I only have to add to that, that even then the learned judge did not conclude the question, for, dealing with an interlocutory injunction as they were, they left the plaintiff, if he thought proper, to try his action at law, and make out, if he could, that there was the false representation, which, if made, would give a ground of action. But it is most important to observe the hypothesis of fact upon which that judgment proceeds, and if the facts such as they have been established in this case could have been made out, I cannot understand that there is any principle of law laid down which would have prevented an injunction, although the defendant's name was "Burgess," and although the article was described by a descriptive name, which, however, had not as matter of fact in that case in the view of the judges the technical significance of being only made by Burgess the father. It seems to me, therefore, that there is nothing in that decision, or, indeed, in any other, which interferes with the propriety of an injunction where the proposition of fact with which I have started can be established, and it is to be observed that, whatever the form of the injunction, if the principle of it is duly observed, it is only such a form as prevents the mischief pointed to. It would be impossible, for instance, to say that a trader could not describe his goods truly by enumerating the particulars of what they consisted unless such description was calculated to deceive and made his goods pass as the goods of another. What in each case or in each trade will produce the effect intended to be prohibited is a matter which must depend upon the circumstances of each trade and the peculiarities of each trade. It would be very rash *a priori* to say how far a thing might or might not be described without being familiar with the technology of the trade. For these reasons I move that the judgment of the Court of Appeal be reversed, and that the respondents do pay to the appellants the costs both here and below.

Lord Herschell said: There appears to me abundant evidence to support the findings of the jury. For many years belting made of camel hair yarn had been known in the markets of the world. It had been sold under a variety of names. But there was ample evidence to justify the finding, that amongst those who were the purchasers of such goods the words "Camel hair" were not applied to belting made of that material in general; that, in short, it did not mean in the market belting made of a particular material, but belting made by a particular manufacturer. It is impossible, I think, to read the correspondence which passed between the defendants and those who were ordering goods of or procuring orders for them without seeing that this was the case. Moreover, it is impossible to doubt that the defendants were well aware of the fact. They begin by calling their belting "Arabian," and state that they are prepared to guarantee it "to be better than the belting commonly called Camel hair belting." They are told by one of their correspondents that if he has a sample similar to the one he forwards (which was made by Reddaway), "stamped Camel Hair Belting, nothing more," he thinks he can take this order from Reddaway's. They do their best to comply with their correspondent's wish, and send belting so stamped. Another correspondent asks for Sooft, which is to be quite equal to Reddaway's "Camel Hair Belting," and which must be in every respect identical to the sample of that make. It was to be stamped "warranted best Camel Hair Belting." In that or another case, it is not quite clear which, the defendants stated to the firm whom they employed to manufacture the belting that no manufacturers name must appear on it, or it would be useless. I see no reason to be otherwise than completely satisfied with the answers which the jury gave. On this assumption I proceed to inquire whether the plaintiffs have made out any right to belief. I cannot help saying that, if the defendants are entitled to lead purchasers to believe that they are getting the the plaintiffs' manufacture when they are not, and thus to cheat them of some of their legitimate trade, I should regret to find that the law was powerless to enforce the most elementary principles of commercial morality. I do not think your lordships are driven to any such conclusion. The principal which is applicable to this class of cases was, in my judgment, well laid down

by Lord Kingsdown in the "Leather Cloth Company v. The American Cloth Company," 11 House of Lords, 538. Lord Kingsdown's words were as follows: "The fundamental rule is, that one man has no right to put off his goods for sale as the goods of a rival trader, and he cannot therefore (in the language of Lord Langdale, in the case of 'Perry v. Truefitt') 'be allowed to use names, marks, letters, or other indicia, by which he may induce purchasers to believe that the goods which he is selling are the manufacture of another person.'" It is in my opinion this fundamental rule which governs all cases, whatever be the particular mode adopted by any man for putting off his goods as those of a rival trader, whether it is done by the use of a mark which has become his trade mark, or in any other way. The name of a person, or words forming part of the common stock of language, may become so far associated with the goods of a particular maker, that it is capable of proof that the use of them by themselves without explanation or qualification by another manufacturer would deceive a purchaser into the belief that he was getting the goods of A, when he was really getting the goods of B. In a case of this description the mere proof by the plaintiff that the defendant was using a name, word, or device which he had adopted to distinguish his goods would not entitle him to any relief. He could only obtain it by proving further that the defendant was using it under such circumstances or in such manner as to put off his goods as the goods of the plaintiff. If he could succeed in proving this, I think he would, on well-established principles, be entitled to an injunction. In my opinion, the doctrine on which the judgment of the Court of Appeal was based, that where a manufacturer has used as his trade mark a descriptive word, he is never entitled to relief against a person who so uses it as to induce in purchasers the belief that they are getting the goods of the manufacturer who has theretofore employed it as his trade mark, is not supported by authority, and cannot be defended on principle. I am unable to see why a man should be allowed in this way more than in any other to deceive purchasers into the belief that they are getting what they are not, and thus to filch the business of a rival. In the present case the jury have found, and in my opinion there was ample evidence to justify it, that the words "camel hair" had in the trade acquired a secondary signification in connection with belting, that they did not convey to persons dealing in belting the idea that it was made of camel's hair, but that it was belting manufactured by the plaintiffs. They have found that the effect of using the words in the manner in which they were used by the defendants would be to lead purchasers to believe that they were obtaining goods manufactured by the plaintiffs, and thus both to deceive them and to injure the plaintiffs. On authority, as well as on principle, I think the plaintiffs are on these facts entitled to relief. Reliance was placed for the respondents upon the decision of Vice Chancellor Wood in "Young v. Macrae," and in the Court of Appeal, Lord Justice Rigby regarded it as adverse to the plaintiff's contention. When carefully examined I do not think it is so. Where a patentee attaches a particular name to the production he patents, that name becomes common property as descriptive of the patented article. It possesses, indeed, no other name. That name would necessarily be applied to it by all persons desiring to purchase the article. It is not descriptive of the production of a particular manufacturer, but of the article itself, by whomsoever it is manufactured. Indeed there is no presumption that the patentee will manufacture it, even during the term of the patent; more often than not patented articles are manufactured by other persons by the licence of the patentee. What right, it was asked, can an individual have to restrain another from using a common English word because he has chosen to employ it as his trade mark? I answer he has no such right; but he has a right to insist that it shall not be used without explanation or qualification if such a use would be an instrument of fraud. Who suffer injury by such a conclusion, or would be the worse if the defendant is thus restrained? It has been shown that the public have not needed the words "camel hair" to describe a particular kind of belting; that the words have never been used in the trade in that sense. What Lord Justice James said in Thorley's case is applicable to the present. He observed: "Thorley's food for cattle had never become an article of commerce, as distinguished from the particular manufactory from which it had proceeded." It is not proposed, in the present case, to prohibit the use of the words "camel hair" altogether. The injunction granted by Justice Collins had not that effect. In the case just referred to, the counsel for the plaintiff, at the conclusion of the judgment, asked whether the substance of their Lordships' judgment was not that the defendants were not to use the name "Thorley" in connection with their cattle food. Lord Justice James replied, "We cannot prohibit them using the name if they use it in a way not calculated to mislead the public." I say the same about the use of the words "camel hair" in the present case. For these reasons I think the judgment of the Court of Appeal should be reversed.

Lord Morris concurred, although he was not quite so clear on the point as his noble friends.

The appeal was accordingly sustained with costs.

## MERSEY AND IRWELL JOINT COMMITTEE.

The usual monthly meeting of this Committee was held on Monday last, at the offices, Mosley St. Manchester, Sir J. T. Hibbert presiding.

The General Purposes Committee reported that they had met to consider the re-appointment of Sir H. Roscoe as chemical adviser, and the decision of the Committee had been in favour of his re-appointment. The Chairman then moved, and Mr. J. Brierley seconded the adoption of the report of the Committee, appointing Sir H. Roscoe chemical adviser for twelve months at an inclusive salary of £725., such salary to include travelling and other expenses.—The motion was adopted.

## THE PROGRESS OF THE COMMITTEE'S WORK.

A voluminous report "on the work which has been done for the prevention of rivers pollution in the Mersey and Irwell watersheds since the Joint Committee was constituted in October, 1891," prepared by Mr. R. A. Tatton, chief inspector, was laid before the meeting.

The report stated that "the system of disposing of cinders from factories, either by tipping them direct into the river or by depositing them on the banks to be washed away by the first flood, has been practically stopped, and the river beds are much improved in consequence. The dredgings from the Ship Canal, into which these solids eventually find their way, now contain hardly any cinders, whereas formerly they were chiefly composed of them. This result has been obtained with but few prosecutions, a remonstrance being usually found sufficient. Constant inspection of the rivers is, however, required." A table showing the progress made during the past four years stated that whereas in May, 1892, there were 27 works in operation under urban authorities, there were in March, 1896, 47 such works in operation, besides five under rural authorities. The works under construction in May, 1892, numbered eight. In March, 1896, they had risen to 30. Orders of Court to cease pollution within definite periods had been obtained in 38 cases in Lancashire and Cheshire and two in Derbyshire.

The progress made by manufacturers had been greater—as far as results were concerned—than by local authorities. This was exemplified by the condition of the rivers, those rivers which were principally polluted by sewage showing less improvement than those in which manufacturing pollution formed a larger proportion. A comparison between the Mersey and Irwell showed this in a marked degree, the former, with a watershed population of 633,493 and only 60 manufacturing works, showing little or no improvement, whereas the Irwell, with a population of 998,624 and 272 manufactories, was decidedly purer, and many of its tributaries which used to be very foul were now in fair order. The report continued:—"There seems, therefore, no reason to doubt that when the sewage pollution has been removed, the rivers will be very different from what they are now, and although in a manufacturing county like Lancashire we cannot expect to get them absolutely pure, they will at least be no longer a disgrace. The Cheshire rivers show less improvement than those of Lancashire, partly from reasons which I have pointed out, and partly from the fact that certain of their tributaries are polluted from manufactories in Yorkshire and Derbyshire; these districts, although they may be dealt with by the Joint Committee under the Act of 1876, do not come within the provisions of the private Act of 1892. In Yorkshire the Joint Committee have entirely held their hand, as a Rivers Board, which is doing excellent work, has been constituted in the West Riding, but having only got their powers in 1894, the work has not progressed so far as it has with us. With regard to the portion of Derbyshire which drains into the Mersey, no action was taken for some time, in the hope that the Derbyshire County Council would undertake the work, but progress is now being made. We have heard many complaints lately as to the unfairness of Lancashire and Cheshire manufacturers being taxed with the expense of purifying their waste waters, whilst other parts of the country are being left alone. This, no doubt, is a hardship, and is a strong argument in favour of the Act being enforced over the whole country." Purification works, the report pointed out, were necessary in 394 factories. Of these 180 had efficient "plant" in March, 1895, as compared with 45 in October, 1893. "Works with plant constructed, but not efficient, numbered 202, as compared with 77." "Works being constructed" numbered 7, in place of 17, and the heading "No treatment adopted" was applied to only 5 works, in place of 191. Mr. Tatton further stated that besides the 394 factories, about 250 drained into sewers, and the waste waters were dealt with by the local authorities. The manufacturers, taken as a whole, had met the Committee in a fair spirit, although to many of them the cost of constructing works had been very considerable. In certain cases proceedings had been found necessary, but before any action was taken the consent of the Local Government Board was required. Application to the Local Government Board had been made in 33 cases, and, with one exception, consent obtained, but in 14 cases only had proceedings become necessary. He impressed on local authorities and manufacturers the importance of the work, as if it was only half

done the rivers, although no doubt improved, would not cease to be a nuisance in the summer, and added that manufacturers who water had in many cases, especially on the Mersey and Irwell derived considerable benefit. This improvement should be until each manufacturer felt that he had a direct interest in the river above him pure. If any assistance was required to object the Committee would certainly give it.

Mr. T. W. Killick moved the adoption of the reports with commendation that it be sent to the different authorities and made concerned.

The Chairman, alluding to the different matters dealt with in the report, said that, on the whole, he considered that it detailed a satisfactory condition of things. He acknowledged the manner in which the Committee had been met by the manufacturers with whom they had to deal in their important duty of cleaning up the rivers on which the works were situated. He thought that the Mersey and Irwell Committee had powers considerably in excess of those granted many other similar bodies in different parts of the country. When they saw the effect of those powers in the river, they felt that they would be convinced that was only an argument of similar powers being extended to those other bodies. (Hear, hear.) He was glad to see that Sir Francis Powell was about to be before Parliament dealing with the question, and he hoped that the effort thus about to be made would be successful.

The report was adopted.

The remainder of the business before the Committee consisted of reports on the progress of works in different towns. The Chief Inspector reported with regard to a complaint as to the pollution of the Ship Canal Docks by a sewer. This sewer originally conducted from Moss Side, and also from a portion of Stretford. The sewage was now diverted, and was treated at the sewage works adjoining the Mersey, below Stretford. The sewage from the district still went into this sewer, but works were being constructed which would admit it into the Manchester system of drains, which would be treated at Davyhulme. The number of visits paid last three months to sewage works was 481, and manufacturing

The Consulting Sub-committee stated that Sir H. Roscoe reported on the analyses of sewage effluents made during the month. Of these, six were good, one fair, five unsatisfactory, and the latter being samples from Hyde and Salford. The Committee having received a letter from the Hyde Corporation, requesting that the consideration of the position of that Corporation be deferred for a month, in order that fresh samples of the effluent might be analysed. The Corporation of Salford had been given notice on April 20th to submit an efficient scheme for the filtration of sewage to the Local Government Board. The report was adopted.

At the conclusion of the general business of the Committee, Sir Henry Roscoe attended, and was informed of his re-appointment as chemical adviser. Sir Henry Roscoe thanked the Committee for the confidence placed in him, and expressed a hope that he would be able to be of some assistance in the future with regard to the task which they had in hand, namely, the purification of the rivers from his own experience and the facts set out in the report. Mr. Tatton, the Chief Inspector, had presented to that meeting, a statement that the condition of the water in the Ship Canal was better than in previous years, and he further stated with regard to effluents from manufacturers' works that he proposed in a short time to present a report showing the result of the works constructed as far as purification was concerned from a chemical point of view. He thought that the manufacturers had met the Committee in a fair manner, and that they ought to be thanked for having eventually attained the result for which the Joint Committee was constituted.

EXPORTS OF PITCH FROM MANCHESTER.—Manchester is now being extensively used by the patent fuel manufacturers of the South of France. Two large consignments left the canal for Cette by the steamers *Bergensen* and *Genova*. This is of considerable importance in providing outward cargoes for the port of Manchester with fruit from Spain, or wood pulp from Northern Europe, which would otherwise have to return to the port elsewhere for a cargo, and greatly increases the attractiveness of the port to owners of such tonnage. Further large shipments are arranged.

SOCIETY OF CHEMICAL INDUSTRY.—Manchester Section is hereby given that the annual meeting of the Section will be held in the rooms of the Chemical Club, Victoria Hotel, Manchester, on Friday, April 10th, 1896, at 7 p.m., to elect five members of the Section as set forth in the amended bye-laws, in the place of the members who are not eligible for re-election. After the election will be a discussion (to be opened by the Chairman) on all matters that have been read before the section, during this session, and the date of this meeting.

## Parliamentary Jottings.

### POTATO DISEASE AND STRAWSONITE.

In the House of Commons, on Monday, in answer to Mr. M'Dermott (Kilkenny, N.).

Mr. Gerald Balfour (Leeds, Central) said: The results of the experiments conducted in 1895 by the Agricultural Department of the Land Commission for the purpose of testing the value of strawsonite and other solutions as preventives of the spread of potato disease in Ireland are fully detailed in the report recently presented to Parliament. These experiments, on the whole, were most successful and satisfactory in their results, and indicate that a timely application of the solution is beneficial, not alone in prolonging the period of growth of the plant, but in lessening the ill-effects of the disease and increasing the relative yield of potatoes. I may remark that the experiments, which were originated in the year 1891 at the request of the Irish Government, have since been carried out from year to year, and the results attained, with other information, have been embodied in leaflets and very extensively circulated throughout Ireland amongst the farming classes and other interested persons. I now propose to ask the Land Commissioners to issue the recent report to Poor Law boards, agricultural societies, and other bodies interested in the matter, as well as to the Press, and also to continue the circulation of the leaflets.

### CORDITE.

In answer to Colonel Lockwood (Essex, Epping),

Lord G. Hamilton (Middlesex, Ealing) said: As yet no cordite has been made in India; but its manufacture is under consideration.

Replying to Colonel Lockwood,

Mr. Powell Williams said: Messrs. Kynoch hold two contracts, one for gun cordite and one for cordite ammunition. The gun cordite is made throughout at Arklow, and on completion is delivered into Government stores at Purfleet. The cordite for the ammunition is brought over by Messrs. Kynoch from Arklow in the form of paste. It is finished at Birmingham, and the cartridges are made up and completed by them at the same place. They are then delivered to Woolwich.

### THE BRINE PUMPING BILL.

On Tuesday last, the House of Lords' Amendments to the Brine Pumping (Compensation for Subsidence) Provisional Order Bill were agreed to by the House of Commons.

## PAPER-MAKING CHEMICALS.

ONE of the disadvantages attaching to sulphite of soda is its tendency to dissociate, whereby it is robbed of its efficacy. A comparatively new salt that combines the advantages of the sulphite without its disadvantages is the double salt composed of two molecules of sulphite of soda, combined with one molecule of carbonate of soda. This salt, which may be termed a

### THIO-CARBONATE OF SODA,

is obtained in the form of crystals, containing 21 molecules of water. It is prepared, according to M. Prentice, who is the originator of the process, by mixing 7 parts by weight of sulphite with 4 parts of soda crystals and dissolving in 12 parts by weight of water. The solution so obtained is evaporated until a skin forms on the surface of the warm liquid. The whole is allowed to cool, and then a previously prepared crystal of the double salt introduced, when crystallation at once sets in. In order to obtain the crystals necessary to start the crystallising process on the large scale, a portion of the solution prepared as above is evaporated in a vacuum over sulphuric acid. It is not necessary to specially prepare the sulphite when sulphur dioxide gas is itself available, as the desired results can be achieved by passing the gas into a solution of sodium carbonate in accordance with the proportions stated in the following equation:—

Before crystallising, the evaporation should be carried farther than is necessary for either of the constituent salts by themselves, as the double salt is soluble in six times its own weight of water. The crystallisation process is always easily accomplished, as the salt is more soluble in warm than cold water.

At the ordinary temperature of the air the crystallised salt does not oxidize, but the crystals gradually lose water and become opaque. At 100° C. they lose all their combined water, which means a loss in weight of 31.35%, provided the salt has been dried out of contact with the air. When heated in the air to a temperature of 100° C. the salt becomes slightly oxidized.

By evaporating the solution at 60° C. an acid variety of the salt is obtained, which, while virtually having the same properties as the

normal salt, has the additional advantage of not losing its water of crystallisation when exposed to the air.

In preparing the solution of the salt for use, and for storing ready made for use in the near future, it is well to note that the solutions when concentrated do not oxidize in the air, but when diluted in the proportion of 1 part to 4 of water, the solution behaves in just the same way that a mixed solution of the two salts (sulphite and carbonate of soda) would.

### BASIC SULPHATE OF ALUMINA.

Among the many methods for the preparation of basic sulphate of Alumina the following is a new and rather ingenious one. It is based on the decomposition of bauxite with bi-sulphate of soda. Clay or bauxite is gently roasted, or even only boiled, with solid, or a solution of the acid sulphate, according to the method of treatment. In this way acid sulphate of alumina and sulphate of soda are obtained. The former is precipitated by treating the solution of the two sulphates with oxide or carbonate of magnesia. The basic sulphate is then separated by filtration, leaving a liquor containing sulphates of magnesia and soda. The former is separated by precipitation with sulphide of soda. The solution of neutral sodium sulphate that remains is evaporated to the crystallising point, crystallised and calcined with coal and sulphate of lime to form sulphide of soda, which is used again for the precipitation of further quantities.

As in each successive cycle of the operation a constantly increasing quantity of sulphate of soda is formed, even when a portion is worked up into sulphide, the excess is employed in the manufacture of the carbonate or hydrate. It can also be sold for the purpose of glass-making.

## THE MINERAL OIL INQUIRY.

A SELECT Committee of the House of Commons was recently appointed to perpetuate the inquiry into the Petroleum laws commenced in 1894. The following are the members that have been nominated:—Right Hon. Jesse Collings, Under-Secretary, Home Office; Sir T. Carmichael, Midlothian; Alexander Cross, Camlachie, Glasgow, of A. Cross and Sons, seed merchants, Glasgow; J. F. Flannery, Shipley; Colonel Sir E. Hill, Bristol, S.; F. Wootton Isaacson, Stepney; J. Kenyon, Bury, Lancashire; Right Hon. A. J. Mundella (chairman), Brightside, Sheffield; H. F. Pollock, Spalding; Harold Reckitt, Brigg; J. Crompton Rickitt, Scarborough; Sir J. B. Stone, Birmingham, E.; and J. Kelly, S. Leitrim. The first witness examined was Colonel Sir Vivian Majendie, her Majesty's Chief Inspector of Explosives, who stated that the great mass of petroleum used in this country was not regulated in any way by law, but only that kind which had a flash-point 73° F., close test. Thus, while the sale of that form of petroleum known as benzoline was regulated, that form which was burned in lamps was under no restriction. He was decidedly of opinion that the present law did not sufficiently provide for the public safety, even as regards that form of petroleum which was regulated. The law was very incomplete, and gravely deficient in elasticity. There was no statutory disability which would prevent anybody from storing any number of thousands of barrels in any part of London, or in any part of any other populous place. There was no regulation prescribing the use of suitable packages for the conveyance of the oil, and there was generally no power vested in any central authority to impose or require to be made regulations enjoining due precautions in the conveyance of petroleum, this being an omission which, in view of the increasing trade in bulk, was of a serious character.

**SAFETY EXPLOSIVES IN GERMAN COAL MINES.**—Mr. Henry Hall and Mr. Joseph S. Martin, two of her Majesty's inspectors of mines, have presented a report to the Home Secretary, which has just been printed, on the visit which they paid at the end of last year to Schalke, near Gelsen-Kirchen, in Westphalia, to investigate the experiments conducted there by Herr Bergassessor Winkhaus. The report contains a detailed description of these experiments, illustrated with reproductions from photographs. The inspectors think that the experiments prove, if further proof was needed, that the use of certain safety explosives in the stead of such explosives as gunpowder, dynamite, gelatine dynamite, gelignite, &c., would substantially diminish the risk of blasting operations in coal mines. English roborite appears to have been hitherto the most successful explosive. Legislation should not only specify the kind of explosive, but should also place a limit on the amount of charge and forbid its ignition except by electricity. It cannot be said that any safety explosive is absolutely safe; either ignition should take place "between shifts," in the absence of the work-people, or the vicinity of each shot should be copiously watered. The inspectors add that gunpowder is entirely forbidden in mines representing about 80 per cent. of the total production (40,000,000 tons) of Westphalia. They recommend that a return should be obtained showing to what extent safety explosives are already in use in England with a view to their compulsory and general adoption.

## The Patent List.

*This list is compiled from Official sources in the Manchester Technical Laboratory, under the immediate supervision of George E. Davis and Alfred R. Davis, who report professionally upon the value of Chemical Patents.*

### APPLICATIONS FOR ENGLISH LETTERS PATENT.

- Improvements in Lubricants. P. R. de F. d'Humy. 5,791. March 16.  
 Improved Manufacture of Soap. P. R. de F. d'Humy. 5,792. March 16.  
 Process and Apparatus for the Manufacture of Nitrate of Ammonia. G. Craig. 5,815. March 16.  
 Water Softening Apparatus. F. H. Tyacke and C. E. Gittins. 5,849. March 16.  
 Making Sewage Precipitants from the Waste Products of the Iron and Steel Industries. W. E. Adeney and W. K. Parry. 5,955. March 17.  
 Manufacture of Aluminate of Barium, or Strontium, also Aluminium Barium Sulphate or the similar Strontium Compound. D. A. Péniaikoff. 6,096. March 18.  
 Sewage Treatment Compounds. H. B. Sharp. 6,132. March 19.  
 Separating Silicic Acid from Argillaceous Substances. F. Brünjes. 6,157. March 19.  
 Separating Dust from Air. H. Simon. 6,164. March 19.  
 Treating Sodium and Potassium Chloride by Electrolysis. C. H. Parker and John Pullman. 6,216. March 20.  
 Treating certain Earths to Extract Soluble Matters therefrom. J. S. Pattinson and Fawcett Preston and Co., Ltd. 6,270. March 21.  
 Producing Double Aluminium Sulphides. D. Péniaikoff. 6,290. March 21.  
 Tanning Skins rapidly without Acids. C. Master and M. J. Myers. 6,325. March 21.

### ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

*These abstracts are specially prepared for the Chemical Trade Journal and ALL RIGHTS of publication are RESERVED. This is the earliest series of abstracts of Chemical and allied patents accessible to the public.*

- Improvements in or Relating to Precipitation Tanks for the Clarification of Sewage and Impure Waters. J. S. Pickering, Pool Bank-street Nuneaton, Warwickshire. Eng. Pat. 4,186. February 27th, 1895.

The tanks at the upper part are fitted with a filtering arrangement formed of planks carried on cross girders, the planks being kept slightly apart by pegs and covered with a filter bed of three sizes of gravel. The filtration takes place from the bottom upwards. The filter bed is flushed periodically by removing the sludge from the bottom of the tank. The filtered sewage overflows from the top of the tank into channels provided for its reception. There are three drawings showing the tank in plan and the bed in sectional elevation.

- Improved Method of Purifying Water. T. Royle, Dalton House, Upton lane, London, E. Eng. Pat. 8,256. April 26th, 1895.

Three parts of a 5% solution of potassium permanganate are added to every 10,000 parts of water to be purified. After complete mixing three parts of a 10% manganous chloride solution are added, and the whole filtered or settled by subsidence. When treating manufacturing effluents permanganate is added until a pink colour is obtained, a similar quantity of the manganous chloride solution being subsequently added. Lime can be used during or after the purifying process to soften the water.

- Improvements in the Treatment of Gas Liquor or like Ammoniacal Liquor, and in Obtaining Useful Products therefrom. H. Bower, 29th Street and Gray's Ferry-road, Philadelphia, U.S.A. Eng. Pat. 8,330. April 26th, 1895.

Metallic iron or a salt of iron is put into the crude gas liquor in sufficient quantity to convert the hydrocyanic and sulphocyanic acids into corresponding iron salts. The mixture is then treated in the stills in the usual way. So far this procedure is the same as that described in Patent 2,918, 1882.

After the ammonia has been expelled, the spent liquor (which now contains ferrocyanide and sulphocyanide of calcium) is treated with an acid solution of cuprous chloride, to form ferrocyanide and sulphocyanide of copper. The chloride is used to form a soluble salt with lime, and the cuprous salt because cuprous sulphocyanide is insoluble. The precipitate is filtered off, and while wet treated with fine iron borings or filings, thus decomposing the copper salts into insoluble ferrocyanide of iron, soluble sulphocyanide, and metallic copper. On treating the ferrocyanide of iron with an alkali, the corresponding alkaline ferrocyanide is obtained, while the solution of sulphocyanide of iron yields crystals of the same on being concentrated.

- Improvements in the Manufacture of Prussiates. H. Bower, 29th Street and Gray's Ferry-road, Philadelphia, U.S.A. Eng. Pat. 8,381. April 1895.

Sulphocyanide of iron is referred to in Specification 8,330, in one of the products resulting from the process therein described *supra*. The present invention relates to the conversion of compound into alkaline prussiates.

Carbonate of potash, iron, and nitrogenous materials are treated the usual way as for the production of prussiate of potash, then at a stage, but preferably towards the end, the sulphocyanide of iron is added in small quantities so as to be thoroughly decomposed and reduced to cyanide. When the fusion is complete the resultant contains cyanide and sulphide of potassium, and sulphide of iron, which, after cooling, is lixiviated with water, forming a prussiate. The chief claim is the decomposition of the sulphocyanide of iron by the cyanide of potassium formed *in situ*.

- A Process for the Electrolytical Production of Zinc from its Oxide. Siemens Bros. and Co., Limited, 12, Queen Anne's Gate, Westminster (communicated by Siemens and Halske, Berlin). Eng. Pat. 1,575. March 22nd, 1896.

The zinc oxide in the prepared ores is dissolved out by a solution of neutral aluminium sulphate, having the composition  $Al_2(SO_4)_3 + 18H_2O$ . This is best done by using a warm solution containing from 100 to 200 grammes of sulphate per litre, which gives a solution of zinc sulphate and basic sulphate of aluminium. After separating the clear solution the same is electrolysed with a current of about three volts. No diaphragm is needed. Iron and steel cathodes can be employed on which the zinc as it deposits also galvanises. The anode is insoluble. While the zinc is thus obtained, the basic sulphate of aluminium is reconverted into the neutral state, and is ready for use over again on a fresh batch of ore.

## THE LIFE WORK OF LIEBIG.

By A. HOWARD.

(Continued from page 211.)

**Basicity of Organic Acids.**—It was largely owing to the influence that Davy's views regarding the nature of acids were more prominently brought under the notice of chemists. According to the older investigation all acids and salts must contain oxygen. Berzelius struck the first blow at this conception when, after his researches on HCl and Cl, he represented this acid as a combination of the elements chlorine with H. Later on Davy and Dulong concluded that H was an essential constituent of acids. Their opinions on this subject were opposed by Berzelius, as they appeared not to be in accord with the electro-chemical theory, in which he had combined and developed the dualistic hypothesis of Lavoisier and the electro-chemical conception of Davy. Consequently Davy and Dulong's views lost ground. Daniell's studies in electrolysis led to new ideas of the electrochemical constitution of acids and salts. The final return to Davy and Dulong's views was largely due to Liebig's papers, in which he advanced his theory of polybasic acids. In the early years of this century chemists held views on the relations of acids and alkalis which practically involved the assumption that all acids are of equal value in their neutralising alkalis, until Graham, in 1833, published his researches on the phosphoric acids and showed that when  $P_2O_5$  (phosphoric anhydride) dissolves in water it can generate three distinct acids, with different powers of neutralising alkalis. In 1837 Liebig, in connection with Dumas, published a paper "on the constitution of acids," in which, for the first time, the theory of polybasic acids was put forward. In the course of his work he soon saw that the hydrogen theory of acids was both probable and convenient. He defined as particular compounds of hydrogen, in which the latter was replaced by metals.

One of the most interesting discussions in which Liebig was related to the constitution and relations of alcohol and ether. According to Liebig the relation of these organic compounds to inorganic substances is very simple and intelligible. They contain a common radical ethyl ( $C_2H_5$ ), alcohol being its hydroxide and ether its oxide. The modern view is in all its essentials founded solely on the views of Liebig, according to which organic chemistry was defined as "chemistry of organic radicals."

**Substitution.**—At first Liebig did not accept the theory of substitution. I should like to briefly indicate the overthrow of the old theory which was effected by this idea of substitution. The dualistic theory was introduced into chemistry by Lavoisier; it reached its highest development in the hands of Berzelius. According to Lavoisier, however great may be the complexity of a compound, we may detect in it evidence of two constituent parts, e.g. :—

Calcium oxide contains a metal Ca and oxygen.  
 $BaSO_4$  is a compound of BaO and  $SO_3$ .

Early in the century Berzelius, by his electro-chemical theory, had offered an explanation of dualistic combination which was consistent with the knowledge of electrolysis then possessed by chemists. Berzelius assumed that the atoms were electrified, and possessed at least two poles, whose quantities of electricity are in most cases unequal. Thus the elements could be classed as positive and negative, according to which electricity prevailed. Chemical combination, according to this theory, consists in the attraction of the dissimilar poles of the atoms, and consequently in the neutralising of the two electricities. As, however, these were not always equal in amount, the compound produced was itself frequently electric, and therefore capable of entering into further combinations. Thus, according to Berzelius, each compound consists of two different parts, as suggested by Lavoisier, which attract each other in consequence of their different states of electrification. In accordance with these ideas Berzelius represents  $\text{BaSO}_4$ ,  $\text{CaSO}_4$ , &c., thus:—

When organic chemistry began to develop, Berzelius tried to bring the radical theory of organic chemistry into agreement with the dualistic hypothesis. According to him compound radicals were unalterable groups. The discovery of trichloro-acetic acid by Dumas led to the abandonment of the views of Berzelius. Here it was found that an electro negative atom like chlorine could replace an electro positive atom of hydrogen in acetic acid without changing the acid properties of the substance. Berzelius, in face of this discovery, vigorously defended his opinions. He was at first supported by Liebig. The reconversion of trichloro-acetic acid into acetic acid by nascent hydrogen convinced Liebig that the character of a chemical substance does not only depend on the nature of its constituent atom, but also on the manner in which these atoms are arranged. He declared that Dumas' theory of substitution explained a great number of phenomena in organic chemistry.

In 1832 Liebig's experiments on the action of chlorine upon alcohol resulted in the discovery of chloroform and chloral. Liebig overlooked the small quantity of H (0.8%) which  $\text{CHCl}_3$  contains, and he called it a chloride of carbon. Fifteen years later chloroform was first employed as an anesthetic by Simpson, of Edinburgh.

Liebig really discovered bromine in the mother liquors from the salt works. He found they contained iodine, and on saturation with chlorine yielded on distillation a liquid having the external properties of iodine chloride ( $\text{I Cl}$ ). The liquid differed in many of its chemical reactions from iodine chloride. Liebig was so certain that the liquid was the chloride of iodine that he was able to explain away the difference. Several months later he received Balard's paper. He had himself really prepared bromine—he had labelled it "chloride of iodine."

Liebig introduced the use of alkaline pyrogallous acid to absorb oxygen in gas analysis.

**Liebig's Condenser.**—Note in *Nat.*, February 20th, 1896. The inventor was C. E. Weigel, professor of chemistry and botany in the university of Griefswald. The account of this apparatus, with diagrams, first appeared in 1771—50 years before Liebig was born. Liebig never described this condenser as his own.

A mere list of the most important of his 318 papers would be far too long and too tedious for a brief paper such as this.

To conclude Liebig's chief contributions to pure chemistry may be mentioned his inquiry into the chemistry of the change of alcohol into vinegar. It had long been known that dilute solutions of alcohol, when exposed to the air, were converted into vinegar. The exact nature of the chemical changes involved for long remained unexplained. He showed that the change takes place in two stages:—

1. Alcohol loses H, and is transformed to aldehyde.
2. Aldehyde takes up O and is transformed into acetic acid.

Liebig noticed the reduction of ammoniacal solutions of  $\text{AgNO}_3$  by aldehyde, and its use in preparing mirrors.

**Fermentation.**—The word fermentation is derived from the Latin *ferreo* (I boil), and may be supposed to owe its origin to the effervescence which occurs when saccharine liquids are left to themselves in contact with air, or when placed in contact with a ferment such as yeast. It was impossible to make any headway at all till the microscope had been perfected; still, a good start had been made in organic chemistry. According to Liebig, fermentation is to be considered an essentially chemical phenomenon. According to his opponents, fermentive changes depend, in many cases at least, on the life process of certain minute organisms. It is one of the distinguishing features of a ferment that a very little of it goes a long way.

An early attempt to explain fermentive changes chemically was that of Berzelius. Lavoisier having shown that sugar is split up by fermentation into alcohol and carbonic acid gas, Berzelius suggested that the action of the yeast is catalytic. This so-called explanation of the phenomena seems to have been regarded for some time as satis-

factory. Since, however, the nature of a catalytic action was not itself understood, it did not in reality throw much new light on the subject. It was simply the employment of a word to cover his ignorance of the subject.

Before it was known that yeast consisted of living cells, Liebig's mechanical chemical theory of fermentation gained many adherents. This theory, which was propounded in the year 1839, attempted to explain alcoholic and other similar processes from one common point of view. Liebig here regarded ferments in general as easily decomposable bodies, from which the stimulus to the decomposition of fermentable substances proceeded.

In 1836 came the important discovery, made simultaneously and independently by Cagniard de Latour and Schwann, that yeast consists of low organisms which are self-propagating. The subsequent researches of Pasteur confirmed the correctness of these observations. From all this the vitalistic theory of fermentation followed as a natural consequence. According to this theory the decomposition of the sugar is dependent upon the vitality and consequent activity of the yeast fungus.

Other processes of fermentation were now investigated from the standpoint thus obtained, with the result that low organisms were found to be the cause of the action in their cases also. I should refer here to the splendid researches of Pasteur upon the acetic and lactic fermentations.

Liebig maintained an antagonistic attitude to the vitalistic theory of fermentation. He did not, indeed, contest the organised nature of yeast, but would not acknowledge that yeast itself gave rise to fermentation through its life processes. Instead of this he assumed in yeast the presence of an albuminous ferment, which, on the death of the plant, he imagined to bring about the decomposition of the sugar into alcohol and carbonic acid.

In spite, however, of the success of the germ theory, it cannot be said that it has overthrown its rival. Although the connection of many fermentations with the life of definite organisms has been clearly proved, there remain a number of changes, which may also be described as fermentations, the occurrence of which does not depend upon such organisms. And, besides, though it is clear that in many cases fermentation depends on the presence of micro-organisms, we do not yet know how these organisms act. We do not know whether they live on the fermentable matter and excrete the products of the fermentation, or whether the microbes produce soluble ferments like the *enzymes*, which afterwards bring about the fermenting of the fermentable substances in some manner more or less like that which Liebig suggested. It may be pointed out that the amount of the products of a fermentation is usually very great in proportion to the mass of the organisms concerned and to the time they are in action. Again, soluble ferments have been isolated from these organisms.

The *enzymes* are believed to be unorganised chemical substances which result from the activity of living cells, e.g., pepsin. The changes which they bring about are analogous to those induced by the organised ferments themselves. Whilst Liebig was wrong in denying the existence of any connection between the organisms and the fermentations, it must be admitted, on the other hand, that his opponents have not yet succeeded in explaining their mode of action; so that it is not impossible that some modification of the theory of Liebig may yet be found useful. The rival theories of fermentation have done a splendid work by stimulating and guiding workers in this field of science, from which rich crops have already been gathered, and which seems to promise results in the future such as the earlier workers may scarce have dared to dream of when they began their labours. Theories seem to be to research that which examinations are to ordinary students of chemistry. They both lead to work being done.

It now seems possible that the difference between an organised and an unorganised ferment may be this—that the active agent of the organised ferment is one which only acts within the cells in which it is formed, and which has not yet, with one or two exceptions, been separated from the cells which contain it; whilst the unorganised ferments are those which can act outside the cells which produce them.

(To be continued.)

**THE NEW DEE IRON WORKS.**—Rapid progress is being made by Messrs. Summers, of Huddersfield, with the erection of their new iron-works on the Dee, near Queensbury. The roofs are ready for placing on several departments. A line has been brought from the new railway at Hawarden Bridge right into the works.

**SALT EXPORTS VIA THE CANAL.** The barque *British America*, 1,050 tons register, sailed from Saltport on Sunday last, for St. John's N.B., with a large cargo of salt, and the barque *Maiden City*, 850 tons, left Runcorn on the same day with a similar cargo, also for St. John's. Both vessels had previously discharged full cargoes of deals from North America.

## THE DIFFICULTIES OF LOW-TEMPERATURE RESEARCH.

AT the Royal Institution, on Friday, last week, Professor Dewar, F.R.S., made some interesting remarks upon the apparatus to be employed and the difficulties to be overcome in approaching the zero of absolute temperature. Below  $-210^{\circ}\text{deg}$ , he said, to obtain a single degree of greater cold involved a positive struggle with nature. The present aim of low-temperature research was to get below the critical point of hydrogen, and the only means by which this was possible was by the adiabatic expansion of hydrogen itself. The principle discovered by Thomson and Joule, that cold was produced if gas at high pressure was allowed to escape from a very minute orifice, had been utilised with success. Thus, if a jet of air at high pressure issued from an orifice one-quarter to one-tenth of an inch in diameter were made to impinge on the outside of a tube containing air, so much cold was produced that the air in the inside tube would condense on the sides in a liquid form, provided, of course, the whole apparatus was efficiently isolated with regard to heat. In a similar manner, a hydrogen jet could be used, as was experimentally shown, to produce a temperature low enough to freeze air to a hard, white solid. A hydrogen jet at ordinary temperatures, however, would give no reduction of temperature; that would only be obtained if the gas were initially cooled to a temperature much nearer its critical point. The efficiency of such a process was by the nature of the case very small, and the fact that the expansion of hydrogen at a pressure of 500 atmospheres and a temperature of  $-200^{\circ}\text{deg}$ , would only produce about  $7^{\circ}\text{deg}$ . of greater cold than would be won by its expansion at the same temperature from a pressure of 100 atmospheres showed the difficulties encountered in attempting to reach temperatures sufficient to liquefy hydrogen. Even suppose the liquefaction accomplished, the difficulty of collection was very great, for the density of liquid hydrogen at the boiling point could not be above one-tenth that of water. But, in spite of these obstacles, Professor Dewar believed that some day some one would succeed in collecting it and carrying out investigations upon its properties.

## Market Reports.

### TAR AND AMMONIA PRODUCTS.

Benzols are firm, with an upward tendency: 90's stand at 2s. 2d. for prompt sales, and 50/90's, 1s. 8d. to 1s. 9d. In carbolic acids there is no change in the price of either crude or crystals. Crude naphtha is steady at 9d., but solvent is rather weaker, the nearest value perhaps being 1s. 3½d. Creosote and anthracene are nominally unaltered. Pitch quiet, at 33s. to 33s. 6d. f.o.b. East Coast.

Sulphate of ammonia is quite out of joint. In London "cover" sales have been fairly good, but the rest of the producers seem to have been out of it altogether. As there are signs of the season coming to a close soon, makers have reduced their prices in a manner hitherto unheard of. Beekton value is £8.; London outside makes, £8. 2s. 6d.; Liverpool, £8.; and Hull and Leith £8.

### THE METAL MARKETS.

LONDON, WEDNESDAY.—Pig iron, dull: Scotch warrants closed at 46s. 7d.; Middlesbrough, 38s. 2½d. cash, and hematite, 48s. 2½d. Copper, steady: Chili bars, G. O. B.'s and G. M. B.'s, closed at £44. 16s. 3d. to £45. 1s. 3d. cash, and £45. 3s. 9d. to £45. 8s. 9d. three months. Tin, firm: Straits closed at £60. 12s. 6d. to £61. 2s. 6d. cash, and £61. 5s. to £61. 15s. three months; Australian, £61. 7s. 6d.; English ingots, £64. 10s. Lead, quiet: Spanish, £11. 1s. 3d. to £11. 2s. 6d.; English, £11. 5s.; Silesian spelter, ordinary, £15. 7s. 6d. to £15. 10s. Nickel, 1s. 2½d. Antimony, £30. Quicksilver: first hands, £6. 17s. 6d.; second hands, £6. 16s. 6d. Copper shares, steady: Cape, 2½ to 2¾; Copiapo, 2 to 2¼; Libiola, 3 to 3¼; Mason and Barry, 2½ to 3½; Rio Tinto, 18½ to 18¾; Tharsis, 5¼ to 5½.

### REPORT ON MANURE MATERIAL.

There has been more inquiry for immediate delivery, and during the week fair business has been done. There is no improvement in mineral phosphates, notwithstanding the reduced output in Florida and Carolina. The quotation for 75/80% Florida is 6d. to 6¼d. per unit, according to port of discharge, and the value of South Carolina river rock is about 5½d. per unit, in cargoes, c.i.f., to United Kingdom. Algerian of similar quality is worth about same price. In the absence of cargoes offering there is nothing fresh to report in River Plate bones. Shippers seem inclined to entertain business at about £3. 17s. 6d. for summer-autumn shipment. On spot, Bombay bone meal is selling at

£4. per ton, ex store, but for March-April shipment £3. 17s. 6d. per ton would be accepted, and perhaps something less. From store £4. per ton required for crushed Kurrachee bones; £3. 17s. 6d. required for March-April shipment. For nitrate of soda there is a good demand, but in face of the large supply the price is steadily maintained, at 8s. to 8s. 1½d. per cwt., according to quality, on spot. Due cargoes are worth barely 8s., ordinary quality. Home-prepared dried blood is selling at 7s. 6d. to 7s. 9d. per unit, free on rails at works, the demand for this article having improved lately.

## LIVERPOOL OIL AND COLOUR MARKET.

WEDNESDAY.

OILS.—Palm oil is easy, but there is more disposition to do business. Sales of Lagos are reported at £19. 10s. to £19. 5s. per ton transit. The conditions of business in olive are greatly restricted, and there is little doing; prices, however, show no signs of weakening at the moment. Linseed is, if anything, a shade firmer in price, but this firmness is about counterbalanced by the check to business. Liverpool makes in export casks are quoted 19s. 9d. to 21s. per cwt. There is no change in cottonseed values, and there is a moderate inquiry at the figures last quoted for Liverpool refined. Virtually, castor oil is the same as last reported, good seconds Calcutta, being unaltered; while business in first pressure French is reported at 2½d., though the quotations range from 2½d. to 2¾d. per lb. Tallow is quiet and unaltered, while resin is moving slowly at the full prices that have been ruling of late. There is a steady demand for spirits of turpentine, at 21s. 3d. per cwt., which price is only applicable to spot parcels. Petroleum is firm, especially refined. Russian is quoted 5¼d., and American 6¼d. to 7½d. per gallon.

COLOURS are steady, without alteration in prices. Ochres: Oxfordshire, common, £10., medium, £12., best, £15. Derbyshire, common, 40s.; medium, 50s., best, 60s.; Welsh, best, 90s., seconds, 50s., and common, 18s.; Irish, Devonshire, 40s. to 45s.; French, J.C., 60s. to 65s.; M.C., 65s. to 67s. 6d. Umber: Turkish quiet; Devonshire, 50s. to 55s. White lead, £16. Red lead unchanged. Venetian red, £6. to £10. Cobalt: Prepared oxide, 9s. 9d.; black, 9s.; blue, 6s. Zaffres: No. 1, 3s. 6d.; No. 2, 2s. 6d. Oxide of iron: Common, £7.; medium, £10.; finest, £20. Zinc oxide, £22. 10s. to £25.

## LIVERPOOL MINERAL MARKET.

The firmness reported last week has been well maintained, and in some minerals there has been a further advance. Manganese still continues scarce; arrivals are *nil*, stocks are exhausted, and the production is not keeping pace with the consumption; prices therefore are springing rapidly, and there is every probability of even a further advance in figures as the consumption is considerably increasing. Ground manganese is also in improved demand, whilst prices continue firm at the last advanced figures, viz., £8., £10., £12., and £15. per ton, according to grade. Manganiferous iron ore naturally follows in the wake of manganese, and prices are advanced 1s. to 2s. per ton this week. Chrome ore: Arrivals are somewhat improved, and prices are practically unaltered; with the increased consumption both for steel and chemical trades advanced prices are anticipated. Bauxite continues brisk at full prices as last quoted, with the probability of a further advance on account of the increased demand for the aluminium metal and other new processes. French chalk: The production can scarcely keep pace with the demand, especially in the higher grades; prices are therefore somewhat advanced upon the last figures, 60s. to 70s., 80s. to 90s., and 100s. to 110s. per ton for "Angel White" brand, according to quality. Wolfram and scheelite continue steady, with more business doing. Ferro-Tungsten and Ferro-chrome are in fair demand, at advanced prices. Arsenic is very scarce, at further advanced prices. Fuller's earth steady, at 50s. for lump, 55s. for ground, and 75s. per ton for impalpable powder, "Emerald" and other brands. Ochres and umbers are quiet, at 60s. to 65s. per ton for J.C. ochre, and 40s. to 45s. per ton for prime umber. Anti-friction ore: There is nothing new to report in this article. Pumice-stone: There is more inquiry for prime lump and powdered; £6. to £7. per ton for powdered and £7. 10s. for prime Tenerife lump. Keiselguhr is in increasing demand, at £4., £6., and £8. 10s. per ton. Asbestos and mica are in good demand, for high-class qualities particularly. Bog ore: Stocks are practically exhausted, and prices are firm. Magnesite: Sales continue slow, at last figures. Plumbago is very active, foundries' and lubricating qualities being brisk at full prices, £6. to £10. per ton, and prime Ceylon at £15. to £20. per ton. Lead ore is quiet, at unaltered prices. Carbonate and sulphate of barytes: The production has somewhat improved, but the demand is quiet. Molybdenite, cerite, euxenite, orthite, etc., are in quiet demand.

**The Gas Enrichment and Solar Oil Co., Ltd.**—CAPITAL, £200,000., divided into 200,000 shares of £1. each, 75,000 of which are six per cent. preference. This company has been formed to acquire the British patents of Dr. Dvorkovitz, or any other similar patents, relating to the improvement in the manufacture of gas and bye-products from petroleum; also to carry on business as producers of and suppliers of water-gas, enriched or not by oil-gas; to import various petroleum products, and to construct, maintain, or improve, acquire, and work any railways, tramroads, steam or other vessels, etc. The signatories are:—E. Lane, 26, Great St. Helens, E.C.; P. Dvorkovitz, Devonshire Chambers, Bishopsgate; B. Parker, St. Michael's Rectory, Cornhill, E.C.; M. W. Ash, 18, Trebovir-road, South Kensington; W. Dunn, 22, St. Collin's-bank, Blackheath; G. C. M. Miller, Rectory-place, Chislehurst; O. Hollebone, St. John's-road, Putney.

**Trapps Oil-Gas Fuel Patent Syndicate.**—CAPITAL, £1,000., in £1. shares. This company has been formed to carry on and transact in Great Britain and elsewhere the business of miners, oil refiners, coal and shale merchants, etc.

**Birds' Soap Co., Ltd.**—CAPITAL, £25,000, in £10. shares. This company has been formed to acquire the South Wales Crown Soap and Candle Co., Ltd., East Moors, Cardiff. The subscribers to the memorandum of agreement are: R. Bird, Ellerslie, Cardiff, oil importer; Mrs. E. Bird, Ellerslie, Cardiff; C. H. Bird, 38, Newport-road, Cardiff, oil importer; Mrs. C. H. Bird, 38, Newport-road, Cardiff; F. G. Bird, 6, Fitzalan-place, Cardiff, oil importer; W. R.

Bird, 46, The Parade, Cardiff, engineer; A. G. Bird, Ellerslie, engineer.

**Aluminium Products Syndicate, Ltd.**—CAPITAL, £6,000, in £1. shares. This company has been formed to carry on the business of dealers in and manufacturers of aluminium, etc., and to carry on the business of curriers and tanners. The subscribers to the memorandum of agreement are:—T. W. Precious, 1, Norland-gardens, Nottm accountant; R. Webb, 14, Saunders-road, Nottm Hill, W.; Mrs. C. Webb, 14, Saunders-road, Nottm Hill, W.; A. H. 23, Bouverie-street, E.C., agent; C. S. Westbrook, 23, Bouverie-street, E.C., clerk; A. J. Goffe, 23, Bouverie-street, E.C., Desenne, 11, Ashburnham-road, Chelsea, assistant.

## IMPORTS OF CHEMICAL PRODUCTS

AT  
THE PRINCIPAL PORTS OF THE UNITED KINGDOM.

### LONDON.

Week ending March 21st.

**Acetate of Lime**—  
U. States, 803 bgs. Johnson & Hooper

**Acetic Acid**—  
Holland, 100 pks. Beresford & Co.  
" 60 A. & M. Zimmermann

**Acetone**—  
Germany, 8 drs. Stein Brs.

**Alum**—  
Holland, 173 pks. Ohlenschlager Brs.  
Belgium, 24 H. Wallace & Co.  
Germany, 120 bgs. R. W. Greff & Co.

**Ammonium Chloride**—  
Holland, 7 cks. H. Lorenz

**Antimony Ore**—  
Australia, 15 t. Vivian, Younger & Co.  
" 8 t. H. Bath & Son

**Asbestos**—

## LATE ADVERTISEMENTS.

### TENDER.

CORPORATION OF MOSSLEY.

GAS DEPARTMENT.

**TENDERS** are invited for the **TAR** produced for Sale at their Works during the 12 months ending the 25th March, 1897; also for **SPENT OXIDE** and the supply of **NEW OXIDE** required. Particulars and forms of Tender from the Manager, Mr. R. MERRELL. Sealed Tenders to be sent to me not later than the 25th instant. The Committee do not bind themselves to accept the highest or any Tender.  
JOSEPH HYDE, Town Clerk.

**A.I.C.**, with considerable experience abroad in the Manufacture and Analysis of Extract of Meat, Canned Goods, Animal Charcoal, Bone Manure, Dried Blood, Fat Extraction, Water Analysis, etc., desires re-engagement in similar or other work, with a view to future partnership. Willing to go abroad. Fluent Portuguese. Excellent Testimonials.—Address, "E.H.R.S., Chemical Trade Journal Office, Manchester.

## Notices.

All communications for the *Chemical Trade Journal* should be addressed, and Cheques and Post Office Orders made payable to—

**DAVIS BROS., 32, Blackfriars Street, MANCHESTER.**

Our Registered Telegraphic Address is—

"Expert, Manchester."

**NATIONAL TELEPHONE 3060.**

The Terms of Subscription, commencing at any date, to the *Chemical Trade Journal*,—payable in advance,—including postage in any part of the world, are as follows:—

|                                |          |
|--------------------------------|----------|
| Yearly (52 numbers) .....      | 12s. 6d. |
| Half-Yearly (26 numbers) ..... | 6s. 6d.  |
| Quarterly (13 numbers) .....   | 3s. 6d.  |

## Advertisements.

Prepaid Advertisements of Situations Vacant, Premises on Sale or To be Let Miscellaneous Wants, and Specific Articles for Sale by Private Contract are inserted in the *Chemical Trade Journal* at the following rates:—

|                                |                       |
|--------------------------------|-----------------------|
| 10 Words and under .....       | 2s. 6d. per insertion |
| Each additional 10 words ..... | 6s. 6d.               |

Advertisements of Situations Wanted are inserted at one-half the above rates when prepaid, viz.:—

|                                |                        |
|--------------------------------|------------------------|
| 10 Words and under .....       | 1s. 6d. per insertion. |
| Each additional 10 words ..... | 6s. 3d. "              |

## INSANITARY ATMOSPHERES.

A GREAT deal is heard about the unhealthiness of smoke and the evils that attend the emission of smoke from factories, and although undoubtedly the products of combustion are harmful in many ways, we are greatly inclined to think that much of the attention the smoke question has received has been arrested by the unsightliness of black smoke, rather than by its intrinsic danger to health; so that if the exits from factory chimneys were not so strikingly dense and black, much less, we think, would have been heard of the evils these iniquitous clouds of soot are said to spread over town and country.

The fact that the harmless portion receives more attention than the colourless but poisonous gases that accompany it does not, however, minimise the importance of the latter. There can be no doubt that in towns where the air is, so to speak, worked very hard, the pouring forth of large quantities of carbon and sulphur dioxides into the atmosphere is not at all desirous or beneficial. The high elevation at which they are discharged tends largely to lessen their deleterious influence but the atmospheric conditions are not always such as to allow the discharged products of combustion to be freely dissipated.

This being so, it would seem that the atmospheric condition of private and public rooms is of still greater importance, as, although the works' gases may descend and help vitiate the air we breathe, it is certain that the contamination of the confined air of buildings will be a more positive source of danger.

Since there is no visible indication that the air is being polluted, the point is one that is very liable to be overlooked in schools and large buildings where it is generally supposed by the occupants, in a vague sort of way, that all the necessary arrangements for the adequate supply of fresh air were made by the architect when designing the building.

It therefore becomes an open question whether many of the pale faces that are attributed to the pollution of the air by smoke are not really traceable to working in rooms and buildings that with the purest of air supplies would very soon become surcharged with carbon dioxide, producing lassitude, headache, and all the other attendant symptoms.

In schools in particular there is we think a danger of the air being thus rendered unfit for respiration, and the subject is one that might well receive the attention of the numerous Sanitary Associations that are at present aiming at the protection of public health. Apparently the case is less flagrant than that of smoke, but there are both facts and figures to show that the question of internal atmospheric pollution is quite as important if not more so than of external.

During the approaching summer we would suggest that the percentage of carbon dioxide in all the board schools and other public schools in some manufacturing centre such

as Manchester should be determined both in the fore and afternoon. If a sufficient number of tests were made to give reliable figures the results would show whether the atmospheres were unduly vitiated or not, under the most favourable conditions for maintaining the air in a salubrious state. For instance, it stands to reason that if it is shown that the air in these school rooms cannot be kept healthy in summer, when none of the oxygen is consumed by the gas-jets, the air will be infinitely worse in winter; and therefore under no conditions can work be done by children without injury to health.

There will not be anything very unprecedented in making such an investigation, but it will not be any the less valuable for that. The subject has received the attention of the advocates of hygienic ventilation in the past, and has recently received further attention owing to the experiments that were made a short time back upon the atmosphere of the Salvation Army night shelters.

In such places it is scarcely to be expected that the atmosphere would be otherwise than bad. The work of other experimenters upon the air of schools shows, however, a state of things as bad, and even worse, than in these shelters. It is not pleasant to think that children are daily endeavouring to exercise and expand their mental powers in an atmosphere of this nature, and yet there is every reason to fear that such is the case. There can be no harm in making the experiments, and if the results are favourable, so much the better. If they are not, we shall have found a clue to the deterioration of physique that seems to accompany the spread of elementary education.

### PATENT LAW REFORM.

THE Patent Law Reform Association, which was founded about four years ago, and has its headquarters in Liverpool, aims at the abolition of the many abuses for which the Patent Office is responsible, and is now endeavouring to press upon the Government the necessity of bringing about a modification of the existing law in three particulars, namely, the cessation of "voiding," the granting of valid titles to patents, and an extension of the average life-time of patents (which at present is five years) to seventeen or twenty-one years. Since 1852, when the French system of charging renewal fees and "voiding" for non-payment of these was introduced in this country, five millions and a half sterling in forfeited fees have been lost by inventors on the 131,167 patents that have voided. It is not surprising that the Americans beat us in mechanical and other inventions, when the British mode of renewal fees causes over ninety per cent. of registered patents to come to grief before there has been time to make them pay, and when £99 is the ordinary charge here for a common fourteen years' patent, as compared with £7. in America for a similar privilege for seventeen years. Besides, in this country, the Patent Office issues no certificate of validity with any new invention, while in the United States, where there is no system of renewal fees, and consequently no voiding, for less than £2. a patent is inspected and certified for validity by the official examining experts, of whom there are more than two hundred. It has been said that in the invention and adoption of new machinery the Americans are a generation ahead of the people in this country; and some confirmation of this view is afforded by the fact that during the last forty years our Yankee cousins could boast of 190,111 full-time patents completely worked out, as against 6,792 such inventions which we free-born Britons have had the privilege of possessing and enjoying. A cynic has described the aim of the British Patent Laws as being "to protect the public against new inventions;" and when we consider the barriers, in the form of heavy scales of fees, of tedious waiting, and of pedantic legal procedure which the would-be inventor in this country has to surmount before he is even within sight of success, the definition given above does not appear altogether inapt. One thing is very certain, and that is that the British system makes it almost impossible for a poor man to derive any profit from an invention which he may discover, or to receive any adequate reward for what may have been the result of years of toil and trouble.

## The Patent List.

*This list is compiled from Official sources in the Manchester Technical Laboratory, under the immediate supervision of George E. Davis and Alfred R. Davis, who report professionally upon the value of Chemical Patents.*

### APPLICATIONS FOR ENGLISH LETTERS PATENT.

Manufacture of Celluloid. M. E. Asselot, *née* Martin. 6,389. March 23.  
Manufacture of Manure. N. F. B. de Mercey. 6,403. March 23.  
Apparatus for Manufacture of Oxygen. A. Sweetser. 6,408. March 23.  
Extracting Sugar with Barium Hydroxysulphide and Regenerating the Latter. W. Feld. 6,508. March 24.  
Decomposing Sodium or Potassium Chloride and Generating Electricity. L. Epstein and F. Marza. 6,520. March 24.  
Improvements in Soap. E. Benz. 6,558. March 25.  
Production of Iron, etc., from its Ores by a new Pyrochemical Process. A. Karyscheff and S. Demmenie. 6,654. March 26.  
Producing Basic Lead Carbonate and Obtaining Bye-products. The Chemical and Electrolytic Syndicate, Ltd., A. J. Steinhardt, and J. L. F. Vogel. 6,655. March 26.  
Obtaining Ammonia, Chlorine, and Hydrochloric Acid from a Mixture of Ammonium Chloride Vapour, Hydrochloric Acid, and Ammonia. F. Bole. 6,808. March 28.  
Manufacture of Carbonic Acid Gas. B. T. L. Thomson. 6,835. March 28.  
Washing and Bleaching Composition. C. M. Levy. 6,836. March 28.  
Improvements in Coke Ovens. G. Hilgenstock. 6,857. March 28.

### ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

*These abstracts are specially prepared for the Chemical Trade Journal and ALL RIGHTS of publication are RESERVED. This is the earliest series of abstracts of Chemical and allied patents accessible to the public.*

Improvements in Apparatus and Appliances for Washing Coal and other Minerals; also applicable for Washing or Separating Chemicals, Vegetable and other Solid or Liquid Matter. P. Muschamp, Warren Grove, Barnsley, and S. Burridge, 25, Change Alley, Sheffield. Eng. Pat. 8,526. April 30th, 1895.

An inclined semi-circular trough is fitted with a spiral conveyor, the radius of the lower portion of the trough corresponding to the radius of the conveyor, so that the former can rock on its axis concentrically with the axis of the conveyor. A stream of water is kept flowing down the trough. The coal or substance to be washed is introduced at the lower end of the trough, and is carried upward by the conveyor against the descending stream of water. Troughs and conveyors, or rocking cradles have been previously employed, and no claim to novelty is preferred in this connection. The essential feature of the invention is the use of a rocking tube or channel fitted with a spiral conveyor, so arranged as to work against, instead of with, the stream of water flowing through the channel.

Improvements in and Apparatus for the Decomposition of Alkaline Nitrates. H. K. Baynes and The Chemical and Electrolytic Syndicate, Limited, both of 6, Clement's-lane, Lombard-street, E.C. Eng. Pat. 7,473. April 9th, 1895.

The alkaline nitrate is mixed intimately with ferric oxide, and then decomposed by heat with the evolution of nitrous fumes, which are at once removed. The decomposition is effected in an inclined, horizontal, revolving retort partially enclosed in a furnace in which it is heated to a cherry red. The inside of the retort is ribbed longitudinally so that as it revolves it picks up and projects the mixture continuously. To ensure the removal of small particles that would cling to the sides and flux, the exterior of the retort is constantly jarred by the blows of a spring hammer, operated by cams or wipers on the body of the retort. The ferric oxide used must be as pure as possible, and about two parts are used to every one of nitrate. The mixture is fed into the upper end of the retort by a hopper and screw-feed, the shaft of the screw being hollow, and thus providing an outlet for the nitrous fumes which are swept out by a current of air or steam introduced at the lower end of the retort. The ultimate product is an alkaline ferrite, which falls through a chamber at the end of the retort into a receptacle, thereby sealing the lower end of the retort and preventing the escape of the nitrous fumes. The alkaline ferrite obtained is decomposed on heating with water into a solution of caustic soda and ferric oxide. An ingenious spring expansion and contraction joint is described for closing and connecting the top of the retort with the feeding hopper. There are four drawings.

**ents in the Manufacture of Cyanides.** H. W. Crowther, The West Bromwich; E. C. Rossiter, Smethwick, and G. S. Albright, Edgbaston, Birmingham. Eng. Pat. 2,659. May 1, 1895.

Cyanides are converted into cyanides by heating with zinc or combine with the sulphur. An arrangement of four pots is used, mechanical agitators and two without. The pots are supported one by a flange, and are provided with lugs for lifting in and in the case of sulpho-cyanide of potassium, sufficient is placed in a drying pot to fill it two-thirds full when melted. The continued while lime kiln gases are passed through. When nature reaches 450° to 500° F. the pot is transferred to the furnace and the agitator introduced. When all is made tight or zinc is introduced and the heating is continued under until the contents are red hot. When on testing, the reaction to be complete, the shaft is disconnected and the pot with the withdrawn from the furnace and allowed to cool. The consequently lixiviated with water, the insoluble sulphide by filtration, and the solution evaporated *in vacuo* until the cyanide salts out.

dealing with sulpho-cyanide of sodium, the pot with the ted, and containing a charge of sulpho-cyanide, is put direct decomposing furnace and the sulpho-cyanide melted in its own crystallisation. When the bulk of the water has been he inert gases are introduced to prevent oxidation and the rried out in the same way as with the potassium salt.

**ents in the Preparation of Chloride of Lead for use in Elec- Storage Batteries, and for other Purposes.** A. R. Davis, 32, Mars-street, Manchester. Eng. Pat. 2,914. May 4, 1895.

Lead is treated with hot dilute hydrochloric acid, the whole ated and kept as near the boiling point as possible. When n contains as much lead chloride as is possible, it is run off es of coolers, where the bulk of the chloride deposits. The er liquor, which overflows into a well, is thrown by an to a heating-tank, situated above the level of the decompos-

More acid is added, as may be required, and the solvent, o about 212°F, is used to dissolve a fresh quantity of lead o cope with increase in the volume of the liquid in , a portion of the cooled solvent is treated with carbonate of ecipitate the lead it contains. The precipitate is substituted valent of oxide in the decomposer, and the liquid is run essels of any suitable material can be used, but preference is amelled iron for the heating and decomposing vessels, which e provided with steam jackets. Instead of hydrochloric acid of this acid with either acetic acid, nitric acid, or both, may There are two drawings.

**ved Method of and Apparatus for Treating Brine in the acture of Salt.** J. Todd, Andreas, Isle of Man. Eng. Pat. 2,342. 1895.

of allowing the gases from the salt pan furnaces to escape the chimney at a temperature of 500° to 700°F., they are the tubes of a vertical tubular boiler, and so to the chimney space round the tubes is filled with brine, which is heated sing to the pans. The top of the boiler is of a conical shape, ystals of salt cannot form on the surface. Owing to this onstruction the brine can be heated above the temperature to form crystals, so that on passing into the pan they at once e boiler is prolonged below the level of the pans so that e settle out and can be removed, leaving the purified brine to e pans. There are plan and sectional elevation drawings.

**ved Odourless Liquid Manure.** G. A. Mackintire, Corona, n, Bath. Eng. Pat. 14,143. July 25, 1895.

ce of sodium nitrate, 3 pecks of goat droppings, 4 gallons of e (or rain water), two or three large lumps of charcoal, and a sure of soot are mixed and allowed to stand two or more he mixture can then be bottled and sealed. One quart to of water make the desired liquid manure.

**OF THE RAND GOLD INDUSTRY.**—The Rand output last upwards of 2,250,000 oz., representing in value nearly o. sterling, and showing an increase over the output of 1894 250,000 oz. The value of the machinery, buildings, and e Rand companies is now computed at about £10,000,000. whilst the aggregate dividends declared by the Rand com- th mining and finance, for 1895 amounted to £3,994,044, as 1,981,854. for 1894. The total output of native gold from during the past nine years has been more than 9,000,000 oz., e of nearly £36,000,000. sterling.

## SOCIETY OF CHEMICAL INDUSTRY.

### LIVERPOOL SECTION.

**T**HIS section met on Wednesday evening, April 1st, at University College. Dr. C. A. Kohn and Mr. C. Louquet Higgins exhibited a number of Röntgen shadowgraphs, which they had taken. These included excellent examples of feet and hands, in which the details of the bones were remarkably clear; the cases of a sprained wrist and a dislocated thumb were especially interesting. They demonstrated also Mr. Edison's recently-discovered method of rendering the "X" rays visible by means of calcium tungstate, this agent giving considerably better results than the barium-platino-cyanide, used by Professor Röntgen. By placing objects between the tube and the screen (for instance coins in a leather purse, weights in a wooden box) the shadows were clearly shown. The bones in the hand and wrist were also distinctly visible on the screen.

Mr. Douglas Herman introduced to the members of the section his improved form of respirator for use by workmen, when engaged amongst noxious gases; the respirator is made to fit closely round the mouth and nose by an air cushion, and fresh air is supplied under pressure, through a long flexible tube, excess air and exhaled air escaping through a simple valve, attached to the top of the "muzzle." In the course of his remarks in connection with the use of respirators, Mr. Herman drew especial attention to the beneficial effect of oxygen supplied under pressure to men who have been "gassed" and insisted that a cylinder of oxygen ought to be kept, and complete instructions as to its use posted up in all works, where there is at any time any possibility of accident from noxious gases.

Mr. James Beveridge contributed a paper, at once interesting and exhaustive, on the manufacture of wood cellulose in Scandinavia. This paper was succeeded by the description of a method for calculating the amount of steam required to dry a ton of paper or pulp, likewise given by Mr. Beveridge, and with which the business of the evening terminated.

### SCOTTISH SECTION.

A meeting of this section took place in Glasgow on Tuesday, April 7th, when there fell to be overtaken the discussion on the paper read by Mr. D. R. Steuart at the March meeting on the standard of flash-point for mineral oil. It was insisted that lamp accidents were never heard of in Scotland where the native oil was almost exclusively used, and the conclusion arrived at was that burning oil of 73° flash-point having proved itself dangerous, the flash-point ought to be raised to 100° Fahrenheit as a plain measure of public safety. The report of the Secretary of the section for the session 1895-96 was read, from which it appeared that the membership roll stands at 293, as compared with 290 at April, 1895. This was favourable so far, but the attendance at meetings had fallen away badly, the reckoning for the year being an average of 17, with a minimum of four. Mr. James Hendrick read a paper on "Experiments with Bordeaux Mixture." He emphasised the close connection between agriculture and chemistry, and particularly the valuable aid the latter had extended to the former in the provision of remedies for the insect and fungoid pests which at times so baffled the efforts of the farmer. Bordeaux mixture was first used about 14 years ago in France to cure, or at least mitigate, the mildew and other like diseases incidental to the vine. Subsequently it was applied largely in other countries, particularly the United States, over a wide field of plant disease, and gradually it had attained to the distinction of being recognised as the most generally useful fungicide in the market. It early made its mark in fighting the diseases to which the potato is subject. The mixture was prepared by adding lime to a solution of copper sulphate until complete precipitation took place. There have, however, been many tentative modifications from time to time, and to these are no doubt due the unsatisfactory results which have sometimes accrued. The use of the mixture has been largest and most successful in Ireland, so far as the British area is concerned. It has been tried in Scotland, but not with the same marked result, probably because stronger and better varieties of potatoes being used there, a like field for distinction is not presented. Experiments had been carried on systematically in the neighbourhood of Glasgow in connection with the Glasgow and West of Scotland Technical College agricultural department, but the results were not satisfactory; and in view of the good work done elsewhere, the failure was somewhat in the nature of a puzzle—one which would require further experiments to clear up. In addition to the business above sketched, the Chairman, Dr. John Clark, made some remarks on the estimation of antimony in ores, etc.

**FERTILIZER FOR MELONS AND CUCUMBERS.**—The following mixture is recommended by M. T. Poggi for the cultivation of melons and cucumbers:—Bone superphosphate, 50 grams; potassium chloride, 20 grams; nitrate of soda, 30 grams. This quantity is to be used for each plant.

## THE LIFE WORK OF LIEBIG.

BY A. HOWARD.

(Continued from page 227.)

*Agriculture.*—Speaking generally, the first twenty years of Liebig's life, after his return from Paris, were devoted to pure chemistry. The next period was distinguished by his remarkable contributions to chemistry as applied to agriculture and physiology. Perhaps some idea of the range and depth of his work over the whole field of pure and applied chemistry may be gained from the fact that, on his death in 1873, it was felt to be impossible that any one man could sufficiently comprehend all the subjects he had advanced, and his share in their advancement, and that, therefore, not one, but three of his colleagues were charged with the duty of delivering commemorative addresses, each one of them undertaking that part of the great master's work with which he was himself most familiar from his own lifework. Vogel delivered the address on agricultural chemistry, Erlinmeyer took his chemical work, and Bischoff physiological chemistry.

Liebig's first writings on agricultural chemistry, and on fermentation, were presented in 1840 to the British Association. "Perfect agriculture," he says, "is the true foundation of all trade and industry; it is the foundation of the riches of states. But a rational system of agriculture cannot be formed without the application of scientific principles. For such a system must be based on an exact acquaintance with the means of nutrition of vegetables, and with the influence of soils and actions of manure upon them. This knowledge we must seek from chemistry, which teaches the mode of investigating the composition, and of studying the character of the different substances from which plants derive their nourishment."

*The Humus Theory.*—Owing to the fact that virgin soils are often particularly well suited for the cultivation of plants, and that these virgin soils have been found to be very rich in vegetable mould, or humus, it had come to be supposed, prior to the date of Liebig's earliest writings on agricultural chemistry, by many chemists and agriculturists, that this vegetable mould was the source of the fertility of these soils. By an extension of this idea many vegetable physiologists ascribed the fertility of all soils to its presence, and even regarded it as the chief nutriment of the plants. It was supposed by them that the humus was extracted from the soil by the roots of the growing plants. In Germany this view was very widely accepted. Liebig showed that humus is almost insoluble in water, and therefore could not be absorbed by plants to any great extent. He showed that the air is the source of the carbon of plants. Humus is woody fibre in a state of decay. In contact with air it undergoes gradual oxidation. Humus, then, represents mainly certain stages in the primitive processes which connect one generation of vegetables with those which succeed it.

The following sentences by Liebig constitute the essence of his doctrine; they already contain the complete programme of the agricultural chemistry which has been created since that time:—"The nutritive materials of all green plants are inorganic substances. . . . Plants live upon carbonic acid, ammonia, water, phosphoric acid, sulphuric acid, silicic acid, lime, magnesia, potash, and iron. Dung, the excrementa of the lower animals and of man, does not act upon plant life through the direct assimilation of its organic elements, but indirectly through the products of its decomposition and putrefaction processes, *i.e.*, by the transformation of its carbon into carbonic acid, and of its nitrogen into ammonia or nitric acid. Organic manure, which consists of portions or *débris* of plants and animals, may be replaced by the inorganic compounds into which it breaks up in the ground." From these axioms Liebig drew the all-important conclusion that the soil must be replenished with whatsoever constituents have been withdrawn from it by the culture of plants, if its exhaustion is to be provided against.

Liebig and his pupils came to the conclusion that free nitrogen as such was not directly assimilated by plants. This view, however, has been overthrown by the researches of Hellriegel and those of Lawes and Gilbert and Warrington in this country.

Liebig's researches on plant nutrition all went to prove that the same substances as are found in the ashes of plants are the true nutrients of the latter, and are absolutely indispensable to them. But they did more than this in showing the significance, not merely of the nutritive materials contained in the soil, but also of the form in which these are present (whether soluble or insoluble), and of their action upon the other constituents.

The earliest series of experiments on the absorption by different soils of the mineral constituents which serve as food for plants was due to Liebig. These observations were of great importance for the explanation of the action of manures.

Notwithstanding, however, that an immense number of new facts have been brought to light through these and other labours, the fundamental principles of Liebig's doctrine have undergone no alteration since he first gave them to the world in his pioneering work of 1840. He clearly recognised in all its broad features how plants draw their nutriment from the constituents of the air and the soil. Upon this he

based his doctrines of rational husbandry, which have already borne the richest fruits, and in the elaboration of which scientific and men are still engaged.

To conclude this brief and incomplete account of Liebig's agriculture, I should like to quote a few lines from Sir Henry's obituary notice in *Nature* for May 8th, 1873:—

"Other and wider questions, to the solution of which Liebig life turned his energies, were those respecting the establishment of scientific agriculture, and the foundation of a new science of logical chemistry. It is in this direction that his labours known to the general public in England, and there is no although in many details his views have since proved erroneous he was correct in the main issues, and that the stimulus British agriculture through Liebig's teaching and investigation been of the most important kind. Agriculturists have been aware that a scientific basis for their practice exists, which, yet complete, can still explain much in their art of what had previously depended on mere empiricism. Then, again, the interest and which were thus brought to bear on these subjects has led to the establishment of agricultural colleges, and to the carrying out of results like those magnificent ones of Lawes and Gilbert, from which receiving information concerning the various questions relating to life such as long continued investigation and observation at the field."

(To be continued.)

## LIABILITY FOR LOSS OF GOODS.

INSTRUCTIVE TEST CASE.

A CASE of considerable importance to merchants and others signing goods by the Ship Canal was decided last week by Honour Judge Parry at the Manchester County Court. The plaintiffs, Messrs. F. Becker and Company, Cannon-street, London, claimed compensation from the Canal Company for the loss of six bales of wood pulp. The defendants, on whose behalf Mr. Langdon appeared, claimed that the bales formed part of a cargo of 3,600 bales imported for Chadwick and Taylor, Ordsall Mills, Salford, per the steamship *Chile*. When the case was heard at a previous sitting of the court, Mr. Newman, for the defendants, said the position of the Canal Company seemed to be misunderstood by those who had business relations with them. The work of transferring the goods over the side of the ship into the waggons was work done for the ship, and did not concern the plaintiffs. The company then acted as hauliers to take the bales to the works of Messrs. Chadwick and Taylor. They only received 10s. per ton for this work. It was not part of their duty to count the goods either in or out of the waggons, or to see to the custody of the goods; they did was to supply the motive power in transferring the goods from point to point. They were not carriers, and the provisions of the Act of haulage distinctly provided only for the use of the canal trucks, and did not cover the checking of the goods. The small sum which they made was presumptive evidence that they were not carriers, but merely as hauliers.

Mr. Langdon now argued the case at some length. He contended that what was termed the order for haulage was really a carriage order, and that as such it was void as being unreasonable within the provisions of the Railway and Canal Traffic Act, 1854. There could be no doubt that this was a bailment of some description, and in support of his contention as to the liability of the company he cited the cases against the North Staffordshire Railway Company, and against the Lancashire and Yorkshire Railway Company. The difference between the conveyance by a railway company and the Canal Company seemed to him to be that the former accepted responsibility which the latter expressly refused. The contention was unreasonable, because the Canal Company absolutely exempted itself from any risk whatever, and because they provided no motive. The siding from the wharves to the plaintiffs' works was undoubtedly the quickest and best form of transit for the goods, and the Canal Company possessed the sole monopoly. The Act of 1854 especially provided that every railway, canal company, or other company, should according to their powers afford facilities for the receiving, forwarding, and delivering of traffic from the several railways and canals belonging to or worked by them. The main point was whether or not the Ship Canal Company was controlled by the Railway and Canal Companies Act.

Mr. Newman said the first question was whether the Canal Company was a railway company within the meaning of the Railway and Canal Traffic Act. He contended they were not. It was true they constructed railways, but it did not follow that because two lines placed equidistant from one another along a piece of ground constituted a railway within the meaning of the Act. The company had no powers to employ traction power for the purposes of haulage; they possessed no certificate from the Board of Trade to use the railways for the purposes of railways.

His Honour: Then under what statutory powers do you make the extract at all?

Mr. Newman replied that the contract for haulage was made simply cause the company owned the lines. Surely there was no objection. His Honour said the company seemed to be doing something which was altogether outside the scope of their powers.

Mr. Newman contended that it was a private line, and as such the canal company had a perfect right to take it up altogether if they so chose. They had always been willing to take the risk of these goods, at a much higher rate than sixpence per ton.

His Honour, in the course of a lengthy judgment, ruled that the contract which provided that the company should take no responsibility whatever was unreasonable. It was also clear that the goods in question passed over a considerable portion of railway upon the company's ways, and it was an extraordinary thing for a company in the position of the Ship Canal Company to come to the court and say that they could not point to anything in their statutes authorizing them to make these haulage charges. He had no doubt that the Canal Company were a railway company bound by the provisions of the Act. That being so, the plaintiffs were entitled to recoup themselves for the loss sustained, and there must be judgment for the amount claimed (£4), with costs. Leave to appeal was granted.

### THE HEATING OF AUSTRALIAN COAL.

AN interesting report upon the conditions of the spontaneous heating of coal has been communicated by the Government Geologist of New South Wales (Mr. E. F. Pitman) to the Minister for Mines in connection with the heating of a coal cargo on board the *Knight of St. Michael*. The report states:—At about 9.30 a.m. on the 25th February found a temperature of 84° Fahr. in the centre of the coal immediately beneath No. 2 hatch, while in the hold near the side of the vessel the temperature was only 77°. It was noticeable that the coal contained large proportion of smalls and dust. At about 9.45 a.m., on the 27th February, I found that the temperature had risen to 88° Fahr. in the centre of the coal under No. 2 hatch, while in the hold near the side of the vessel it was 76°. At the same hour the temperature of the coal in No. 3 hatch was 79°, and in No. 4 hold it was 73°, while the shade temperature on deck was 69°. It is clear from the foregoing remarks that the temperature of portions of the cargo is at the present time abnormally high, and there is reason for believing that, if left alone, it would continue to increase until spontaneous combustion ensued. Samples of the coal taken by me have been analysed by Mr. J. C. Lingay in the Departmental Laboratory, with the following results:—

#### FROM NO. 2 HATCH.

|                            | 1      | 2      |
|----------------------------|--------|--------|
| Hygroscopic moisture ..... | 2.65   | 2.81   |
| Volatile hydrocarbon ..... | 35.80  | 35.32  |
| Fixed carbon ..            | 55.30  | 54.47  |
| Ash .....                  | 6.25   | 7.40   |
|                            | 100.00 | 100.00 |
| Sulphur .....              | 0.535  | 0.453  |

#### FROM NO. 4 HATCH.

|                            |        |
|----------------------------|--------|
| Hygroscopic moisture ..... | 2.45   |
| Volatile hydrocarbon ..... | 37.65  |
| Fixed carbon .....         | 52.30  |
| Ash .....                  | 7.70   |
|                            | 100.00 |
| Sulphur .....              | 0.508  |

It may be stated, therefore, that the cargo consists of semi-bituminous coal of good quality, but containing a large proportion of dust and smalls. The coal was, I am informed, screened at the pit mouth, and in the present condition is, I presume, due to subsequent handling.

From the investigation of eminent European authorities, such as Richter, Fayal, Lewes, and others, there can be little doubt—first, that the principal cause of spontaneous combustion in coal is the absorption of oxygen by the coal; and second, that the most favourable conditions for the self-heating of coal are a mixture of pieces and dust, an elevated temperature, a large mass or volume of coal to act as a non-conducting covering, and a certain volume of air. These conditions are precisely those which exist in the *Knight of St. Michael's* cargo. The cargo was, I understand, loaded during the abnormally hot weather which prevailed at the end of January, and it is probable, therefore, that it reached the hold with an initial temperature of from 100 to 150 deg. Fahr. In loading from the trucks at Newcastle a considerable proportion of smalls and dust has been produced by the fall of the coal by the process of trimming; by the filling up of the hold the large volume of coal necessary to form a non-conducting covering has been provided, while just about sufficient air has access to the hold to com-

plete the necessary conditions. I am of opinion, therefore, that the heating of the cargo of the ship, *Knight of St. Michael*, is due, firstly, to the fact that the coal contains a large proportion of 'smalls' and 'dust,' and secondly, to its having been loaded during abnormally hot weather. The proportion of 'smalls' and 'dust' has no doubt been increased by the shifting operations which have taken place since the arrival of the ship in Port Jackson, and I am of opinion that considerable risk would be incurred if the *Knight of St. Michael* were allowed to put to sea with her cargo in its present state."

### EXPORTS OF ALKALI AND BLEACH.

THE following returns, which are taken from the official foreign and colonial statistics of the United Kingdom, give the amount and value of alkali and bleaching materials shipped to the undermentioned countries for month ending February 29th, 1896, as compared with 1895:—

#### ALKALI.

| Port.                    | 1895.   | 1896.   | 1895.  | 1896.  |

### HINTS TO BRITISH TRADERS.

THE British Consul at Calais, Mr. Keene, addresses, in the course of a report, some advice to British firms as to the conduct of Continental business:—"Judging by the letters and circulars a consul receives during a year," he says, "he is evidently supposed by many British firms to be their lawful medium for promoting the sale of their goods. However able and willing a consul may be to supply such information as he properly can as to the trade requirements of his district, it is impossible for him to act as a general agent for British firms. British trade cannot hope to be pushed entirely by the instrumentality of the consul, or by demands addressed to him for a list of the principal importers and retailers of manufactures, ranging from needles to heavy machinery. Neither can it be expected that British foreign trade will be greatly extended until British chambers of commerce and British traders recognise the fact that the distribution among consuls of illustrated price lists and other advertisements which, though displayed in the consulates, rarely, if ever, lead to an order, is of infinitesimal value as compared with the persuasive manner of the well-trained traveller or agent of other countries, of Germany especially, who has made a study of the business habits and requirements of the several districts he visits. This is a subject I have touched on in one of my reports from another country, and one on which several consuls have strongly expressed their opinions, but, so far as I can see, without the desired result. It is undoubtedly the duty of a British consul to assist British subjects in their mercantile concerns as far as he can properly do so consistently with the discharge of his shipping and other duties, but however anxious he may be to promote and increase British trade, he can hardly hope to succeed if the British trader will not help himself."

HOLIDAY STOPPAGES IN THE ALKALI TRADE.—The United Alkali Co., Ltd., have closed their chemical works at St. Helens, Widnes, and other places, from Thursday, 2nd inst., until Monday, 13th inst., thus prolonging the holiday break from the usual two or three days to ten.

### THE MINERAL OIL INQUIRY.

AT the last sitting of the Select Committee of the House of Commons, appointed to inquire into the working of the Petroleum Acts, Mr. A. Spender, chief officer of the Public Control Department of the London County Council, gave it as his opinion that the existing Petroleum Acts were quite inadequate. They dealt wholly with Petroleum spirit, which was much less in use than petroleum oil, the result being that the great bulk of petroleum coming into the country was subject to no control whatever. The County Council had made representations to the Government on the subject. Petroleum spirit had practically ceased to be used for illuminating purposes, but, at the same time, the quantity used for trade and manufacturing purposes was constantly increasing. There were in London 360 premises licensed for the use of petroleum spirit for trade or manufacturing purposes. It was of the greatest importance that the spirit should be contained in properly sealed vessels, in order to minimize the danger arising from the escape of vapour. In the conveyance of the spirit the County Council were strongly of opinion that it should be in properly closed vessels. The Council had approved of underground premises for storage purposes, and one dangerous fire in the neighbourhood of the Thames, in which great quantities of resin were burning, had proved the safety of underground storage. The object of obtaining further powers in respect of petroleum oil was to enable the authorities to deal with reckless or want-of-thought people. There were people who would drop matches on petroleum-saturated floors, which might cause formidable fires. He quoted statistics showing the growth in the importation of petroleum oil during the last six years, and mentioned that while the import of American oil had gone on increasing that from Russia had decreased. In his opinion, the Bill of 1891 introduced by the Home Office would meet the whole requirements in regard to the storage and carriage of oil. The witness reserved his evidence with regard to dangerous lamps. The committee adjourned for the Easter recess.

### PRODUCTION AND COST OF RUSSIAN PETROLEUM.

AN extensive description of the oil field of Baku, Russia, with full and most interesting particulars regarding modes of drilling, characteristics of the oil, &c., is given in a recent issue of the *Pittsburg Times* by B. H. Butler, a staff correspondent who was sent to visit the field. In his account Mr. Butler says that the Baku wells are situated in four places. South of Baku about two miles is Bibi-Eibat, a field about a fourth of a mile square, which is now producing about as much oil as all the fields in America that are producing "Pennsylvania" oil. Eight miles south of Baku is Balakhani, the greatest field of Russia. This field appeared about two miles long by half as much in width. Close by and really an extension is Saboonchi, and further east the small region of Romances. The four fields do not cover a scope of more than four square miles. The Romancee field is famous from containing the big well of Aaddulacoff, which flowed at one time 150,000 barrels a day more than all the wells of America combined were doing at the same time.

Of the production and cost of Russian oil, this report says: In 1894 eight wells reached a monthly production of more than 120,000 barrels each, and these wells are responsible for more than one-fifth of the total yield for the year. Of the wells completed in 1894 only two were finished with eight-inch pipe at the bottom (for all the wells must be cased to the extreme end of the hole). The balance were finished with pipe ranging from 10 to 22 inches. It can be easily seen that a well with a small six-inch hole, as they are drilled in the United States, would not permit the free discharge of the sand a Russian well vomits, to say nothing of the oil that it is expected to send to the surface. But a 16-inch hole at the bottom of the well, enlarging to 28 at the surface is different.

The cost of producing oil at Baku is in some wells enormous as compared with the results. A small well is not a fortune. On the other hand, the reward from a big well is so great that the average cost and the average result compare quite favourably. Drilling a well is figured to cost, including everything, about £4. a foot. Contractors, working as in America, get about £1. a foot until 700 feet is reached, when the price is materially advanced.

To produce the oil when the hole is down costs 2½ cents a barrel for royalty, and, if the well has to be pumped, about 5 cents for pumping. The pump is an ordinary bailer, probably 40 feet long and a foot in diameter. In the smaller holes, of course, the diameter must be less. The average producer should have at least 15 cents a barrel for his crude, and the smaller wells need more to be profitable. Yet 15 cents from February, 1891, to November, 1894, was away above the market price. From September, 1891, to June, 1894, the price had rarely been as high as 10 cents, and averaged about 7 cents. Now, however, it is good, running in the neighbourhood of 30 cents.

The average daily production of the 46 wells completed in 444 barrels when finished. These same 46 wells in 1894, the for which figures are available, did an average of 66 barrels wells finished in 1890 had an initial production of 284 barrels well, which declined in 1894 to an average of 100 barrels to The average production of 87 wells drilled in 1894 gives the startling figure of 1,037 to the well as the daily average production. This is on a basis sustained for several months of the year—not what the wells started at.

The flowing well does not produce the bulk of the oil at the well, regardless of the phenomenal output of the giants. The figures will show the proportion produced by the gusher and pumper in the past eight years:

| Year.      | Flowing well. | Total Production |
|------------|---------------|------------------|
| 1888 ..... | 8,760,000     | 21,840,000       |
| 1889 ..... | 5,040,000     | 23,040,000       |
| 1890 ..... | 6,000,000     | 27,156,000       |
| 1891 ..... | 4,680,000     | 32,952,000       |
| 1892 ..... | 9,120,000     | 34,380,000       |
| 1893 ..... | 13,080,000    | 38,964,000       |
| 1894 ..... | 7,320,000     | 35,700,000       |
| 1895 ..... | 13,000,000    | 45,100,000       |

These figures represent barrels of 42 gallons each, the American measure.

In 1894, 220 wells were deepened, cleaned out or repaired in manner; that is to say, they had stopped producing, and not to bring them into play again. Of the wells finished in 1894, begun in 1890, eight were commenced in 1891, seven in 1892; in 1893, which shows that drilling in Russia is not the swiftest the world.

As may be imagined, it would be impractical, if not impossible, for the well owner to provide tankage for his big production when it is struck. So he wisely attempts nothing of the kind. In the fields there are not enough iron tanks to contain the total of half-a-dozen of the monsters. Therefore the "cistern" is not to play. It is a hole in the ground, and in America it would be a pool or reservoir. Some of them are nothing but the salt water once were part of the sea before it receded to its present dimensions. These lakes make model reservoirs for oil, for water-tight, and the water in them serves as a bottom to keep the oil from the dirt. Imagine a lake with a few feet of oil run on top of the water, and you have the true conception of the "tankage" of most of the Russian oil. Of these open lakes and pools there are 111, which will hold 12,000,000 barrels of oil. To produce in some measure several of the pools have been covered. Covered earth-pools have a capacity of 5,000,000 barrels. An experiment on the earth-pool is the stone reservoir, of which 49 cover 82 open cisterns will hold 3,000,000 barrels. The iron tank less than a thousand, and will store 3,286,000 barrels, from which it is seen that the iron tanks in Baku are of small consequence in the care of the production.

In supposing that Baku makes no good oil, the American is wrong. While it is quite different from our Pennsylvania crude, Russian oil is finding favour in a great many places. The heavy oil of about 0.87 specific gravity. The tendency is to oil as the wells go deeper. The oil has a dark colour, is of an odour, free from sulphur, with an asphalt base. It is not a light oil, like the Ohio crude, although in some respects it resembles it. The Russian oil is lacking in the life that characterizes Pennsylvania oil. On that account it does not deteriorate much when turned into great reservoirs in the ground.

The field is well equipped with refineries, of which about 100 are in the minority, but do the bulk of the refining. The refineries are chiefly situated at Baku, piping the oil from the adjacent fields. The refiners are experts, and employ able chemists, keeping in touch with any good methods that are at any place. They aim to get from the crude about 30 per cent illuminant, 20 per cent of lubricant, and of "astatki" or about 35 per cent, leaving some waste. This proportion realised, probably from 25 to 28 per cent. of illuminating oil is a real result. The refined oil, of course, varies according to the man who makes it. If he is eager to get the largest percentage of refined, he will press the distillation for quantity the result of a heavy oil, of a high fire test, which will not burn in the lamp. I saw a cargo loaded at Batoum on a tank steamship was certified by the official inspector as of a specific gravity of 0.84 with a flash test of 84 degrees by Abel's close test. The colour between a light amber and standard white. It was bound for America and China.

Of the lighter products, like benzene and gasoline, hardly a drop is discovered in Russian crude to speak of. Nor is paraffine, or by-products that help the American refiner. After the lamp

lubricating oil are taken off in the refinery, all the balance is astatki, except a proportion of waste, which is practically an asphalt residuum, and as such has been used to some extent in fixing the streets of Baku. Astatki is really one of the most valuable of all the products of distillation. Russia is short on coal and wood in the southern parts particularly. Wood in Baku is worth £2. to £2. 5s. a cord. So astatki is a fuel in general use, except in the city limits, where it is largely forbidden.

### THE TYNE CHEMICAL TRADE.

THE following list has been specially abstracted from the yearly analysis made by the Tyne Improvement Commissioners of goods imported and exported from the Tyne in 1895. As the figures include coastwise shipments, the coastwise total is given as well as the total for the year, the difference being the amount of foreign imports or exports, as the case may be. The annual total for 1894 is also given for the purpose of comparison:—

| Description of Goods.                | IMPORTS.                  |                 |                 |
|--------------------------------------|---------------------------|-----------------|-----------------|
|                                      | Total.<br>Coast-<br>wise. | Total.<br>1895. | Total.<br>1894. |
| Candles .. .. .                      | tons 1,057                | 1,061           | 1,088           |
| Cement .. .. .                       | 905                       | 912             | 839             |
| Barytes .. .. .                      | 256                       | 2,519           | 2,911           |
| Nitre and Salt Cakes .. .. .         | 5,610                     | 5,610           | 4,152           |

It is interesting to know to or from what countries the chief shipments of some of the more important items go or come, and we therefore append the following special analysis:—

**Imports:—**Holland and Belgium supply the greater part of the barytes, and Germany about a seventh less than these two conjointly. The quantity of glucose from U.S.A. is about 100 tons higher than in 1894. The shipments of cotton and linseed cakes from Russia have increased more than fourfold, but Germany has fallen out completely. Of phosphates, 11,356 tons were from U.S.A., and 3,251 from Belgium, this being an increase in the former and a decrease in the latter case. Of bones, 516 tons came from South America. There is a slight increase in the U.S.A. shipments of mineral oils, and a marked increase in the total for Russia. Wood pulp was chiefly sent from Norway, the total being 2,329 tons, against 11,03 tons in 1894.

**Exports:—**Norway was the sole recipient of blacking. The largest shipment of alkali was sent to Sweden, followed in order of size by Belgium, Russia, and U.S.A. The total for the latter port was 1,075 tons, against 527 tons in 1894. Of bleach, Belgium takes the lead, instead of Russia, with a total of 5,016 tons, followed by Russia, Germany, and U.S.A. Russia took most caustic soda, with 1,948 tons, the next being U.S.A., with 1,855 tons, against 2,205 tons in 1894, after which Spain, Italy, and Germany come next in order. The Russian increase is very marked, as that country came fourth in order of shipments in 1894. U.S.A. takes the lead with hypo. Belgium and Denmark took most soda crystals. Silicate of soda was sent mainly to Spain and Russia. The only important shipment of salt was sent to South America. Belgium took 12,255 tons of slag and mill cinders.

### EXPORTS OF PETROLEUM FROM U.S.A.

THE Chief of the Bureau of Statistics, Washington, gives the following returns of the exports of petroleum and petroleum products for February, 1896. The total shipments were 57,967,088 gallons, compared with 60,645,714 gallons in 1895. The total for the eight months ending February, 1896, was 586,420,860 gallons, against 611,206,989 gallons during the same period in 1895. The details of the shipments are as follow:—

| CRUDE PETROLEUM.              |            | Gallons. |
|-------------------------------|------------|----------|
| Total, February, 1896 .. .. . | 7,413,237  |          |
| " " 1895 .. .. .              | 6,605,968  |          |

| " " 1895 .. .. .              | 756        |          |

**Obituary.**—We regret to record the death of Mr. John Cannington, of the well-known firm of Cannington, Shaw, and Co., glass bottle, etc., manufacturers, St. Helens, which took place on Friday, 3rd inst. Mr. Cannington was 75 years of age.

## Trade Notes.

**MESSRS. F. PEARN AND CO., LIMITED.**—The Manchester City Council recently confirmed the acceptance by the Gas Committee of the tender of Messrs. Pearn and Co., Limited, for two hydraulic double "Goliath" pumps for water-gas plant.

**THE WANTAGE SEWAGE SCHEME.**—The scheme submitted by Mr. C. A. Atkinson, C.E., of the Liverpool firm of Goodison, Atkinson, and Forde, civil engineers, for the sewerage and sewage disposal for the town of Wantage, Berkshire, has been accepted by the council.

**THARSIS COMPANY'S DIVIDEND.**—The dividend of 17½ per cent. for 1895, announced by the directors of the Tharsis Sulphur and Copper Company, Limited, was a pleasant surprise, as the market only expected 12½ per cent. In 1894 the dividend was 10 per cent., in 1893 12½ per cent., in 1892 15 per cent., and in 1891 12½ per cent.

**FIRE AT A DISTILLERY.**—Early on Tuesday morning a fire broke out at Harbey's distillery, Port Dundas, Glasgow, originating from the explosion of spirit vapour. The stillhouse was at once enveloped in flames, and the stillman, Donald M'Lellan, aged 33, was severely burned in escaping. Damage estimated at £5,000. was done before the fire was extinguished.

**SOCIETY OF CHEMICAL INDUSTRY: London Section.**—The next meeting will be held at Burlington House on Monday, April 13th, at 8 p.m. After the election of officers for the session 1896-7, a paper will be read by Mr. R. W. Sindall on "The Estimation of Water in Wood Pulp;" and also one by Mr. Watson Smith on "A Study of Comparative Affinities in the Case of Certain Salts of Ammonia—Part II."

**PETROLEUM DISCOVERIES IN SPAIN.**—Large petroleum deposits have been discovered near Conil in the province of Cadiz. The territory was recently inspected by the chief engineer of the province, and English engineers were engaged to commence drilling. The owner of the property, Faustina Caro, has applied for the necessary government permit, which is to cover 4.59 acres.

**IMPROVEMENT IN AMERICAN FERTILISER TRADE.**—Owing to the improved financial condition of American cotton planters, and their resolution to devote increased attention to cotton this year, there has been a marked advance in fertiliser sales. The returns published by the Georgia Agricultural Department show that the sales of fertilisers during the present season to March 14th reached 310,000 tons, against 150,000 tons to the corresponding date in 1895, or the total of only 220,000 tons during the whole of last season.

**WATER IN BUTTER.**—Joseph Inman, grocer, Bednall-street, Queen's-road, and of Buckley-street, Oldham-road, Manchester, was summoned on Wednesday before the city justices, under the Food and Drugs Act, for selling to an inspector on the 13th ult. butter containing 21.8 per cent. of water. Mr. G. Rook, who prosecuted, said this was the first prosecution in Manchester since the hearing of an important case two years ago. There had, however, been many convictions for similar offences in different parts of the country. Mr. C. Estcourt, the city analyst, said that the sample of butter submitted to his inspection contained nearly 22 per cent. of water. It was not heavily salted, and 15 per cent. of water was an ample allowance in such cases. The defendant said the butter was in the same condition when sold as it was when he bought it. A fine of 20s. and costs was imposed.

**THE FAILSWORTH SEWAGE PURIFICATION WORKS.**—These works were recently formally opened. The works are situated at Clayton Bridge, near to the Newton Heath boundary of the township. Mr. James Wild (chairman of the Failsworth District Council) presided. The Chairman, prior to handing to Mr. Dunkerley (chairman of the Sewage Disposal Committee) a gold key with which to unlock the valve controlling the outfall works, said that the scheme for the treatment of sewage was now completed, and, in his opinion, it would turn out to be the best of its kind in the county. That was a great deal to say for a little place like Failsworth. (Hear, hear.) Mr. Dunkerley said he had much pleasure in declaring the works open. (Applause.) He rejoiced to think that they were superior to anything of the kind in this part of the country. Indeed, he was not sure whether Failsworth was not the pioneer township in the matter of adopting this particular kind of aerated process of filtration. Practical experiments had conclusively proved that the system which they were adopting was the very embodiment of sanitary science and experience brought down to modern times. (Hear, hear.) In the conception and carrying out of the details of these works, Mr. Lomax, their engineer, had shown an ability and experience, coupled with a judgment, such as was rarely found in so young a man. (Hear, hear.) At the conclusion of the speech-making, the company proceeded to inspect the precipitation tanks and filter beds, and witnessed them in operation.

**EXTRAORDINARY STATEMENTS ABOUT MARGARINE.**—A meeting of the Nantwich Farmers' Club was held on Saturday last, to discuss and take action with reference to Bills before Parliament affecting the interests of agriculturists. Speaking with respect to the Agricultural Produce Marks Bill and the Prevention of Fraud Bill, Mr. Sadler, the secretary, said the public were hoodwinked by fancy names which were given to rubbish put upon the market. Only last week two farmers, from whom he received the statement first hand, visited a bone works, and in being shown round the premises their attention was attracted by a heap of bones. A quantity of these bones were human bones, which had probably been collected from a recent battlefield. Near this heap of bones was a great tub of fat, which, they were informed, had been boiled out of the bones. When asked what was done with it, the reply was—"We sell it at £17. per ton, and it can be manufactured into margarine." It was their duty, as farmers, to enlighten the public in regard to these preparations, and, once enlightened, the public would prefer Cheshire butter at a reasonable price rather than margarine which was made from fat procured from human bones and from animals which were probably affected with all kinds of disease.—[Were these two gentlemen hoaxed? If not, ought the matter to end here?—ED., C.T.J.]

## NOTICES.

### LONDON AGENTS

Booksellers and Newsagents may now obtain supplies

"THE CHEMICAL TRADE JOURNAL"

From

MR. JOHN HEYWOOD,

2, Amen Corner,

On usual trade terms.

Paternoster Row, E.C.

### FOREIGN REMITTANCES.

Owing to the inconvenience created by the various ways in which foreign subscriptions are remitted, we respectfully beg to inform subscribers that a *Crossed MONEY ORDER* is the most satisfactory method of remitting, both for them and ourselves. In the case of a Money Order, a letter advising us of same should always be sent, otherwise, owing to post-office formalities, much delay in tracing and acknowledging foreign remittances is inevitably entailed in this country.

## Market Reports.

### TAR AND AMMONIA PRODUCTS.

Benzols are steady, with 90's at 2s. 2d. and 50/90's 1s. 8d. Carbolic acids are rather easier, 60% crude being a penny lower and 40% crystals down to 8d. Crude naphtha is unaltered at 9d., while solvent is a shade easier, the quotation now being 1s. 3d. Creosote and anthracene are both about the same, the former, if anything, inclining to weakness. Pitch is quiet at 33s. f.o.b. East Coast.

Business in sulphate of ammonia has been broken and uncertain during this week. The demand has been indifferent, and export orders scarce. Prices remain at the same dead level, Beckton being quoted £8., London outside makes, £8. 2s. 6d., Liverpool, £8., Hull £8., and Leith £7. 17s. 6d., all prompt. Nitrate firm, but rather quiet.

### MISCELLANEOUS CHEMICAL MARKET.

Business in the alkali trade is rather quieter on the whole. Prices, however, remain firm, as values are generally recognized to be at their lowest point, and any fluctuation in the market demand is met rather by curtailment in output than by reduction in price. Ammonia alkali steady at £3. 7s. 6d., bags, makers' works. Caustic soda, f.o.b. Liverpool, 77%, £9. 7s. 6d.; 74%, £8. 7s. 6d.; 70%, £7. 7s. 6d.; 60%, £6. 7s. 6d. per ton, 10-ton lots and upwards. Leblanc ash 1d. to 1½d. per degree, f.o.b., in casks. Soda crystals 32s. 6d. to 35s. per ton, bags, f.o.b. makers' works. Bleaching powder on the whole is quiet, and price is steady at £7. per ton, f.o.b., spot delivery, and £6. 15s. for contracts; £7. to £7. 5s. f.o.b. Liverpool, according to market. Chlorate of potash 4½d., and chlorate of soda 6¼d. per lb. Saltcake in rather better inquiry at 22s. to 23s., f.o.b. Sulphur £3. 12s. 6d. per ton. For vitriol and muriatic acid there is a fairly steady demand, and no change in price. In potash, caustic and carbonate, business is still brisk, and prices are firm. Sulphate of copper £18. 10s., f.o.b. Brown acetate of lime without quotable

Other acetates and acetic acid in moderate request, and steady. Yellow prussiate of potash quiet at  $7\frac{1}{4}$ d. to  $7\frac{1}{2}$ d. prussiate of soda  $6\frac{1}{4}$ d. to  $6\frac{1}{2}$ d. per lb. White powdered iron, and in limited supply at  $\pounds 23$ . to  $\pounds 24$ . for forward delivery. Nitrates very scarce, and higher prices ruling. Nitrate of soda cwt. Ammonia and salts generally are steady. Carbolic slightly easier: 8d. per lb. for 39/40%; liquid carbolic 1s. 2d. n. Reports from all districts indicate a rather quiet state of miscellaneous chemicals.

### REPORT ON MANURE MATERIAL.

Business during the week has been somewhat interrupted by the frost, but there continues to be a fair demand for prompt and early delivery.

Quotations for mineral phosphates are unchanged. The price of River Plate bones is as last reported, there being sellers for at  $\pounds 3$ . 17s. 6d. per ton. On spot, Bombay bone meal is at  $\pounds 4$ . per ton, ex store, and this price would have to be paid for Kurrachee bones. For March-April shipment  $\pounds 3$ . 17s. 6d. was asked for Bombay bone meal, and for later shipment some would no doubt be accepted. The demand for nitrate of soda is up, and spot price is 8s. to 8s.  $1\frac{1}{4}$ d. per cwt., according to quality.

Due cargoes are worth about 7s.  $10\frac{1}{2}$ d. per cwt., and autumn shipment 8s. 3d. to 8s. 6d. Home-prepared dried fishers at 7s. 6d. per unit, free on rails at works.

### LIVERPOOL MINERAL MARKET.

Up to the holidays the market has been rather quiet, but there is a prospect of good business for next week. The scarcity of iron ore still continues, arrivals being *nil*, prices are therefore high, particularly as the demand is now strong, and the stocks of buyers are being very much reduced. Ground manganese is in good demand, and prices are firm at  $\pounds 8$ .,  $\pounds 10$ .,  $\pounds 12$ ., 5s. per ton, according to quality. Manganiferous iron ore is at high prices. Chrome ore: Arrivals have been only very small and prices are unaltered. Bauxite is in good demand at 20s. for first, 18s. for second, and 12s. for third quality, f.o.b.; several shipments have been made this week. French chalk: The demand is still strong, especially for the higher grades of "Angel White" brands, prices are firm at 65s. to 70s., 80s. to 90s., and 100s. to 110s. per ton. "Angel White" brands. Wolfram and scheelite continue in demand. Ferro-tungsten and ferro-chromium are also in better demand. Arsenic continues scarce at very high prices. Fuller's earth at 50s. for lump, 55s. for powdered, and 75s. per ton for ble powdered, "Emerald," and other brands. Ochres and iron are in quiet demand at 60s. to 65s. per ton for J.C. ochre, and 45s. per ton for prime umber. Antifricion ore is without change. Stone: There is more inquiry for this, prime powdered being at  $\pounds 6$ . to  $\pounds 7$ . per ton, and prime Tenerife lump at  $\pounds 7$ . 10s. 6d. is in increasing demand at  $\pounds 4$ .,  $\pounds 6$ ., and  $\pounds 8$ . per ton. Silica and mica are in good demand, for high-class qualities early. Bog ore: Stocks are practically exhausted, and prices are firm. Magnesite continues to sell slowly at last figures. Graphite is very active for foundry and lubricating qualities at  $\pounds 6$ . per ton, and prime Ceylon at  $\pounds 15$ . to  $\pounds 20$ . per ton. Carbonate of barium: The production has somewhat improved, but demand still continues quiet. Molybdenite, cerite, euxenite, etc., meet with a quiet demand.

### THE METAL MARKETS.

LONDON, WEDNESDAY.—Pig iron, dull: Scotch warrants at 46s.  $9\frac{1}{2}$ d.; Middlesbrough, 38s.  $3\frac{1}{2}$ d. cash, and hematite, 40s. Copper, easy: Chili bars, G. O. B.'s and G. M. B.'s, at  $\pounds 45$ . 5s. to  $\pounds 45$ . 10s. cash, and  $\pounds 45$ . 15s. on 15th. Tin, steady: Straits closed at  $\pounds 60$ . 2s. 6d. to  $\pounds 60$ . 12s. 6d. and  $\pounds 60$ . 15s. to  $\pounds 61$ . 5s. three months; Australian,  $\pounds 60$ . 1s.; English ingots,  $\pounds 64$ . Lead, easy: Spanish,  $\pounds 11$ .; Silesian spelter, ordinary,  $\pounds 15$ . 10s. 11s. 3d. Nickel, 1s.  $2\frac{1}{2}$ d. Antimony,  $\pounds 30$ . 5s. Quicksilver, first hands,  $\pounds 6$ . 17s. 6d.; second hands,  $\pounds 6$ . 16s. 6d. Copper firm: Cape,  $2\frac{3}{4}$  to  $2\frac{1}{2}$ ; Copiapo, 2 to  $2\frac{1}{4}$ ; Libiola, 3 to  $3\frac{1}{4}$ ; and Barry,  $2\frac{1}{2}$  to  $3\frac{1}{4}$ ; Rio Tinto, 18 $\frac{1}{4}$  to 18 $\frac{3}{4}$ ; Tharsis, 5 $\frac{1}{2}$ .

GLASGOW, WEDNESDAY.—Market quiet and steady. Scotch pig iron at 46s. 10d. cash, also at 47s. one month; closing with buyers at 46s. 9 $\frac{1}{2}$ d. cash, sellers ask 46s. 10d. Cleveland done at 38s. 4d. also at 38s. 6d. one month; closing with buyers at 38s.  $3\frac{1}{2}$ d. Sellers ask 38s.  $4\frac{1}{2}$ d. Cumberland hematite closes with buyers at 7d. cash, sellers ask 48s. 8d. Middlesbrough hematite closes with buyers at 46s. cash, sellers ask 46s. 0 $\frac{1}{2}$ d.

### LIVERPOOL OIL AND COLOUR MARKET.

WEDNESDAY.

OILS.—Palm oil is quiet, with only a small business doing in Lagos at  $\pounds 19$ . 2s. 6d. per ton, for delivery over this month. Olive is steady, though rather quiet; prices are firm, with a moderate activity in Spanish. There is no change in the price of linseed, Liverpool makes being still quoted 19s. 9d. to 21s. per cwt., in export casks. Cottonseed is firm, with Liverpool refined at 17s. to 17s. 6d. per cwt. There is a rather better inquiry for castor oil, though prices are unaltered; good seconds Calcutta being quoted at  $2\frac{1}{4}$ d. to  $2\frac{1}{2}$ d.; first pressure French  $2\frac{3}{4}$ d. to  $2\frac{1}{2}$ d. per lb. Tallow has not recovered from the holidays yet, and is very dull, without any change in prices. There is a moderate demand for resin at the old values, but, with the exception of the small spot demand, business is very quiet. Spirits of turpentine are rather quiet. There has been a small spot inquiry, and as yet sellers remain firm at 21s. 3d. per cwt. Petroleum is steady, with American at  $6\frac{1}{4}$ d. to  $7\frac{1}{2}$ d., and Russian refined  $5\frac{3}{4}$ d. per gallon.

COLOURS are steady, without alteration in prices. Ochres: Oxfordshire, common,  $\pounds 10$ ., medium,  $\pounds 12$ ., best,  $\pounds 15$ . Derbyshire, common, 40s.; medium, 50s., best, 60s.; Welsh, best, 90s., seconds, 50s., and common, 18s.; Irish, Devonshire, 40s. to 45s.; French, J.C., 60s. to 65s.; M.C., 65s. to 67s. 6d. Umber: Turkish quiet; Devonshire, 50s. to 55s. White lead,  $\pounds 16$ . Red lead unchanged. Venetian red,  $\pounds 6$ . to  $\pounds 10$ . Cobalt: Prepared oxide, 9s. 9d.; black, 9s.; blue, 6s. Zaffres: No. 1, 3s. 6d.; No. 2, 2s. 6d. Oxide of iron: Common,  $\pounds 7$ .; medium,  $\pounds 10$ .; finest,  $\pounds 20$ . Zinc oxide,  $\pounds 22$ . 10s. to  $\pounds 25$ .

### TYNE CHEMICAL REPORT.

TUESDAY.

Chemicals remain in much the same position, though there is rather more shipping. Soda crystals,  $\pounds 2$ . 2s. 6d. per ton, gross weight, locally. Caustic, 76/77%,  $\pounds 9$ . 5s. per ton; 70%,  $\pounds 7$ . 10s. to  $\pounds 7$ . 15s. per ton. Sulphur,  $\pounds 3$ . 17s. 6d. per ton. Other articles unchanged.

Bleaching powder, softs,  $\pounds 7$ . 5s. per ton, nett; hards,  $\pounds 7$ . 10s. per ton, nett; caustic soda, 76/77%,  $\pounds 9$ . 5s. per ton, nett; do., 70%,  $\pounds 7$ . 15s. per ton, nett; recovered sulphur, 2 cwt. bags,  $\pounds 3$ . 17s. 6d. per ton, nett; soda ash, 48%,  $\pounds 4$ . per ton, nett; do., 50%,  $\pounds 4$ . 3s. 4d. per ton, nett; do., 52%,  $\pounds 4$ . 6s. 8d. per ton, nett; alkali, 36%,  $\pounds 2$ . 15s. per ton, nett; white alkali, 48%,  $\pounds 4$ . 10s. per ton, nett; do., 50%,  $\pounds 4$ . 15s. per ton, nett; do., 52%,  $\pounds 5$ . per ton, nett; hyposulphite of soda, 5-7 cwt. casks,  $\pounds 6$ . 5s. per ton, nett; do., 1 cwt. kegs,  $\pounds 7$ . per ton, nett; silicate of soda, 75° Tw.,  $\pounds 2$ . 12s. 6d. per ton, nett; do., 100° Tw.,  $\pounds 3$ . per ton, nett; do., 140° Tw.,  $\pounds 3$ . 7s. 6d. per ton, nett; soda crystals, casks,  $\pounds 2$ . 2s. 6d. per ton, gross weight; do., 2 cwt. bags,  $\pounds 2$ . 2s. 6d. per ton, nett weight; chlorate of potash, 5d. per lb., less 6%; pearl hardening,  $\pounds 3$ . per ton, nett; pure white sulphate of alumina,  $\pounds 3$ . 17s. 6d. per ton, nett; blanc fixe,  $\pounds 7$ . 5s. per ton, nett; chloride of barium, refined crystals,  $\pounds 6$ . 15s., per ton, nett; do., 90/95%, crude calcined,  $\pounds 6$ . per ton, nett; sulphide of barium, crystals,  $\pounds 4$ . 15s. per ton, nett; carbonate of alumina,  $\pounds 30$ . per ton, nett; aluminate of soda,  $\pounds 30$ . per ton, nett.

SALT.—South Durham in better demand, at 9s. to 9s. 6d. per ton, f.o.b. Tees.

COALS have been in rather better demand, and with the opening of the Baltic larger shipments are anticipated. Coke is firm, and the demand seems to be still increasing. Prices to-day are:—Best Northumbrian steam, 8s. to 8s. 6d. per ton; second qualities, 7s. to 7s. 6d. per ton; small steam, 3s. 9d. to 4s. per ton; bunker coals, unscreened, 6s. 3d. to 6s. 9d. per ton; gas coals, 7s. to 7s. 3d. per ton; household coals, 10s. to 10s. 6d.; coke, very steady, 14s. 6d. to 15s. per ton.

### WEST OF SCOTLAND CHEMICALS.

GLASGOW, TUESDAY.

The spring holidays have interrupted business considerably, and at the same time checked production to a slight extent, but the normal position is now being regained. There is a fair average of business passing, and despatch for the Baltic upper ports is now beginning to take shape, much of the stowage space available being already bespoken. Prices are not as yet affected in any way as regards the standard chemicals, and in the others there are one or two changes only. Sulphate of ammonia continues to droop, and last week the unprecedentedly low mark of  $\pounds 7$ . 17s. 6d. was touched for spot Leith. Production has been very large, and stocks in some cases are excessive. In the mineral oil and paraffin sections the only change is the gradual extinction of the call for burning oil with the advance of the season. Prices, however, are not at all affected, and makers are busy stocking.

Chief prices current are:—Soda crystals,  $\pounds 2$ . 2s. 6d., nett, Tyne;

soda ash, 48/56°, £3. 15s. to £4. 15s. nett, Tyne; white alkali, 48/52°, £4. 10s. to £5. nett, Tyne; alum in lump, £5. to £5. 5s. nett, Glasgow; caustic soda, white, 74° £8. 7s. 6d., 70/72° £7. 7s. 6d., 60/62° £6. 7s. 6d., and cream 60/62° £6. 7s. 6d., all nett, Liverpool; bleaching powder, £7. nett, Tyne; saltcake, 24s.; borax, English, refined, £20., and boracic acid, £30. nett, Glasgow; bicarbonate of soda, 5-cwt. casks, £6. 10s., and 1-cwt. casks £6. 15s. nett, Liverpool; bichromate of potash, 4½d. nett, for Scotch and English deliveries (for export, 4½d. nett, f.o.b. Glasgow); bichromate of soda, 3½d. nett, for Scotch and English deliveries (for export, 3½d. nett, f.o.b. Glasgow); chlorate of potash, 4½d. less 5%, Liverpool; nitrate of soda, 8s. to 8s. 3d.; sulphate of ammonia, £8. to £8. 1s. 3d., prompt, f.o.b. Leith; salammioniac, first and second white, £39. and £37. nett, any port; sulphate of copper, £18. 10s. to £18. 15s., less 5%, Liverpool; paraffin scale, hard, 1½d., and soft, 1½d. to 1½d. per lb.; paraffin wax, 120° semi-refined, 2½d. to 2½d.; paraffin spirit (naphtha), 7d. per gallon; paraffin oil (burning) No. 1, 6½d., and crystal, 6½d., at works, for Scotch buyers (English sales about ½d. lower); ditto (lubricating) 865° £5., 885° £5. 10s. to £6., and 890/895° £6. to £6. 10s. Week's imports of sugar at Greenock were nil.

## New Companies.

"H.B." Linseed Oil Co., Ltd.—CAPITAL, £40,000., in £1. shares. This company has been formed to acquire certain patents relating to improvements in manufacturing and refining pale boiled oil, etc., and the interest therein of the "H.B." Oil Syndicate, Limited, upon the terms of an agreement made by this company with the said "H.B." Oil Syndicate, Limited, and to carry on business as seed crushers, oil refiners, etc., oil and colour men, etc.

W. R. Hatton and Sons, Limited.—CAPITAL, £25,000 in £1. shares. This company has been formed to carry on the business of

W. R. Hatton and Sons, Wormwood Scrubbs, and trade as ch soap, and laundry requisite manufacturers.

Mineral Oils Corporation, Limited.—CAPITAL £120,000 £10. shares. This company has been formed to carry on the business of oil refiners, dealers, merchants, carriers, factors, and etc. The subscribers to the memorandum of association are: C. Hunting, 1, Exchange Buildings, Newcastle, shipowner; Hunting, 1, Exchange Buildings, Newcastle, shipowner; Arthur, Victoria-road, Clapham, lieutenant-col.; J. Duffield, A. Royton, ironmaster; E. A. Gibson, 30, Great St. Helens, broker; W. J. Eltringham, 40, Stanton-road, Newcastle, second J. Turnbull, Whickham, co. Durham, clerk.

Lyons' Inks, Limited.—CAPITAL £20,000., in 2,000 5% once cumulative shares of £5 each, and 10,000 ordinary £1. The company has been formed to acquire and carry on the business of ink, sealing wax, and gum manufacturers, now carried on by J. at Park-street, Manchester, and London. The subscribers memorandum of association are:—J. Lyons, Park-street, Manchester, ink manufacturer; J. H. Peters, 62, King-street, Manchester, soap; H. Simmons, 71, King-street, Manchester, chartered accountant; W. Orme, Wellington-road, Stockport, solicitor; T. Collier, V Park, Manchester, manager; G. Kilvert, 32, Trafalgar-road, Bir gentleman; Mrs. F. S. Lyons, 12, Grosvenor-road, Birkdale.

## Gazette Notices.

### PARTNERSHIPS DISSOLVED.

W. E. NAVLOR, H. S. NAVLOR, and J. P. QUICK, varnish manufacturers, James-street, Oxford-street, W., and Southall, under the style of Nayl and Quick.

T. WALTON and R. WALTON, flint glass manufacturers, Newton-le-Wharf, under the style of Walton and Co.

## LATE ADVERTISEMENTS.

### TENDER.

RICHMOND MAIN SEWERAGE BOARD.

CONTRACTS FOR STORES.

THE Board are prepared to receive Tenders for the following STORES required at their Works during the year ending 31st May, 1897:—

1. Steam Coal (Welsh).
2. House Cobble.
3. Lime, for Precipitation.
4. Lime, for Sludge Pressing.
5. Sulphate of Alumina, etc.
6. Filter Cloth.

Specifications may be seen, and forms of Tender obtained, on personal application to the Engineer, Mr. WILLIAM FAIRLEY, Main Drainage Works, Mortlake, S.W. Sealed Tenders, on the forms supplied by the Board, to be delivered to the undersigned on or before Tuesday, the 12th May, 1896.

Security for due fulfilment of Contracts will be required in accordance with the provisions of the Public Health Act, 1875.

The Board do not bind themselves to accept the lowest or any Tender.

J. LESLIE G. POWELL,

Clerk to the Board.

17, The Green, Richmond, Surrey,  
April, 1896.

A FIRM of Chemical Manufacturers and Brokers are prepared to make favourable terms with anyone having large connection and able to introduce new good paying department or speciality in Chemical or allied trades. Particulars in confidence to "Mutual," *Chemical Trade Journal* Office, Manchester.

## Notices.

All communications for the *Chemical Trade Journal* should be addressed, and Cheques and Post Office Orders made payable to—

DAVIS BROS., 32, Blackfriars Street, MANCHESTER.

Our Registered Telegraphic Address is—

"Expert, Manchester."

NATIONAL TELEPHONE 3060.

## Advertisements.

Prepaid Advertisements of Situations Vacant, Premises on Sale or To be Let, Miscellaneous Wants, and Specific Articles for Sale by Private Contract are inserted in the *Chemical Trade Journal* at the following rates:—

20 Words and under .....

2s. 6d. per insertion

Each additional 10 words .....

0s. 6d.

Advertisements of Situations Wanted are inserted at one-half the above rates when prepaid, viz.:—

20 Words and under .....

2s. 6d. per insertion,

Each additional 10 words .....

0s. 3d.

## THE ADULTERATION OF FERTILIZERS AND FEEDING STUFFS.

THE recently published report of the consulting chemist to the Royal Agricultural Society, on the adulteration of fertilizers and feeding stuffs during 1895, is very interesting, as it gives a fairly good insight into the working of the latest legislation in this connection.

The direct adulteration of well-known fertilizers does not appear to be practised so much as the substitution of comparatively worthless preparations under names that cause them to be accepted by the unwary as identical with better known and efficacious materials.

In connection with feeding stuffs there is apparently far more genuine adulteration to be coped with, especially in connection with those excellent but occasionally mysterious preparations sold as compound cakes. The Act of 1891 does not seem to have been framed so as to adequately deal with these preparations. The question of purity does not come in, and, although testing well, there is reason to apprehend that some of the components are obtained from indifferent sources, while others are either unsound or inferior.

Russian linseed cakes—so-called—also appear to be of doubtful value, and by reason of their ingeniously worded appellation open the door to considerable deception. This outlet has, however, been practically closed by the Chemical Committee of the Society, who have warned dealers, in a circular, that the invoicing of goods as linseed cake, whether qualified by an adjective or not, is held by the law to imply a warranty that the article is pure, or, in other words, prepared from linseed only. That many of these Russian cakes are largely mixed with spurry, rape, and mustard seeds the analyses made by the Society only too clearly show. In connection with cakes, the desirable practice of selling by "guaranteed analysis" is of itself liable to become a source of evil. This is not so much due to any fault on the part of the law, or in one sense of the seller, as to the carelessness of the buyers, who are quite content if the goods are sold to them on a guaranteed analysis, which is a very different thing to buying on a guarantee. Farmers do not seem to appreciate these subtleties of business tactics, while on the other hand there are plenty who are fully alive to the possibilities of taking advantage of the confidence inspired by the word "guaranteed." As a matter of fact all makers are not in the same boat, but Dr. Voelcker is of the opinion that there are tons and tons of mixed cakes sold which if analysed would not come up to the made-much-of guaranteed composition. In consequence, those who purchase in this blindfold fashion (being tempted to do so perhaps by a slight concession in price) are constantly finding, as the result of the deal, that it was not the feeding cake alone that the vendor "sold." The realisation of this, however, is arrived at too tardily, as a rule, to enable the sufferers to obtain any redress; so they grumble at, and blame every-

body except themselves, and everything save their own callousness for allowing such "sharks" to exist. Yet the chances are that six months later they will again fall victims to the first stranger who comes along with a low-priced, craftily-named article, the merits of which are ardently but apparently disinterestedly pleaded in plausible and persuasive tones.

With regard to fertilizers proper, the chief difficulty seems to arise not from the selling of actually worthless preparations, but from the habit of charging exorbitant prices for low grade fertilizers which at a fair price would be well worth purchasing.

Thus, a special mangel manure offered at 140s. per ton could only show on analysis sufficient fertilizing ingredients to bring the actual value up to 90s. Another eye-opener was a manure costing 70s., that proved on analysis to be worth less than 25s. per ton.

While the report directly says a good word for basic slag, it indirectly says something better by showing up, at some length, how easily slag manures, that are not made from basic slags, can be "written up" so as to rival the genuine article, in spite of the distinct admission that the substitute is not a basic slag. Such statements are supplemented by analyses, and though such important ingredients as potash and phosphoric acid only occur to the extent of "traces," this deficiency is discounted by ingeniously, if not altogether truthfully, extolling the valuable part played by the remaining components when placed on the soil.

Apart from this particular phase of adulteration, few cases have been met with, and even those are comparatively insignificant.

The present Act therefore is apparently not only capable of doing good, but has done good, while the future benefits to be derived depend almost wholly upon the efforts farmers make to protect themselves. Unfortunately, many of them seem to think that an Act of Parliament ought not only to afford them the means for protection against fraud, but ought, further, to find out all fraudulent dealers and include them in the schedule. So long as agriculturists persist in adopting this childish attitude of plaintive passivity their calling will be a barren one, and they themselves unappreciated martyrs.

### PROFESSOR DEWAR'S LIQUID AIR REFRIGERATOR.

THOUGH the liquefaction of air and other gases is a subject which has been brought into considerable prominence during the last ten years, the physical laws relating thereto were fully demonstrated some thirty or forty years ago by Joule and Thompson.

Piazzi Smyth, in 1839, showed that when compressed air was permitted to flow a reservoir through a nozzle that there was a considerable reduction in the temperature of the air. Later, Faraday, at the Royal Institution, demonstrated the same, but in his liquefaction researches he always employed cooling as well as pressure to effect his purpose. He succeeded in liquefying all gases except oxygen, hydrogen, nitrogen, carbonic oxide, and nitric oxide. How near he came to liquefying oxygen can now be realised when we know that he had oxygen compressed in a tube to 90 atmospheres pressure, cooled with carbonic acid exhausted with a good air pump. Had his apparatus only been a little more perfect, oxygen would have been liquefied 35 years before Cailletet or Pictet tackled the problem. Probably many a far-reaching discovery has been delayed for years for similar reasons. In the year 1857 Sir William Siemens, who invented the regenerator for heat, took out provisional protection for an interchanger for cold, a principle which is employed in almost every modern refrigerating machine. In 1882, Coleman and McKendrick, using such an interchanger with a small Bell-Coleman Refrigerator, reached a temperature as low as  $-90^{\circ}\text{C}$ ., and in a lecture at the Royal Institution stated that there was no reason, except expense, why much lower temperatures and the production of liquid air in quantity could not be obtained. Pictet, Cailletet, and Dewar had before this demonstrated the possibility of the liquefaction of air and oxygen, but it remained for Dewar to make the production of such liquids possible in quantity, and to

place within the reach of all a new field for discovery and attainment of research which must ultimately wrest from Nature many of her most profound secrets. A good beginning has already been made to witness the many recent important researches made at the Royal Institution. However, the field is so large that it would be impossible for one institution or individual to do more than explore the borderland of the subject, so Professor Dewar has devoted some of his time to devising an apparatus, requiring little skill or attention to manage which can be used in any laboratory to demonstrate the properties of liquid gases or for research work. In fact, 100 c.c. of liquid oxygen at atmospheric pressure and a temperature of  $-180^{\circ}\text{C}$ . can be obtained with about as little trouble as distilling the same quantity of water. This apparatus, which we illustrate, has been put on the market by Messrs. Lennox, Reynolds, and Fyfe, of Rosebank, Fulham, London, S.W., the sole makers. It consists of two cylinders of compressed gas, carbonic acid, and oxygen or air and a Refrigerator. The principle on which this apparatus works is as follows:—Liquid carbonic acid from the first cylinder is injected

chamber containing a coil of copper tube, cooling it to  $-80^{\circ}$ . Through this coil is passed compressed air or oxygen, which, after being cooled to  $-80^{\circ}$ , is led into an "interchanger." At the bottom of the interchanger is a valve which expands the compressed gas into a vacuum tube. In expanding, the gas is lowered in temperature about 100 degrees, so that for every atmosphere it has been compressed ( $120 \times 25 = 3000$ ), the expanded gas then travels back over the interchanger, and is cooled below the critical point of air or oxygen, which at this stage comes out of the valve like a jet of steam; shortly after it liquefies, and is collected in the tube. Using 4 lbs. of carbonic acid and 35 cubic feet of oxygen 100 to 150 c.c.'s of liquid is produced. The construction of such apparatus involves design and work of the highest order. The balancing of parts, insulation, material, and strength have all to be so arranged as to prevent leakage of heat.

This is the crux of the problem, and the makers have truly succeeded when such results are obtainable with the small quantity of material in circulation, no motive power being required, only of compressed gases.

GERMAN CHEMICAL DIVIDENDS.—The Badische Anilin- und Soda-Fabrik, of Ludwigshafen, has declared a dividend of 26 per cent. for last year, as against 25 per cent. for 1894. The gross profit for 1895 was £394,988. The dividend of Meister, Lucius, and Brüning, of Höchst-on-the-Main, for last year will be at the rate of 10 per cent., which is the same as the dividend declared for 1894.

## The Patent List.

*It is compiled from Official sources in the Manchester Laboratory, under the immediate supervision of Davis and Alfred R. Davis, who report professionally value of Chemical Patents.*

### NOTIFICATIONS FOR ENGLISH LETTERS PATENT.

**Plants in Filter Presses.** W. E. Heys. 6,873. March 30.  
**Cyanides from Blast Furnace Dust and other Crude Sources.** 6,887. March 30.  
**Metals from Ores by Chlorine Gas.** O. Frölich. 6,921.  
**Generating Sodium or Potassium Chloride and Generating Electricity.** in and F. Marza. 7,000. March 31.  
**Ammonia from Waste Sugar Extraction Lyes.** H. H. Lake. March 31.  
**Process for Obtaining Potassium Cyanide.** A. C. Thomson. 7,062.

**Metallic Sulphides.** A. von Siemens. 7,123. April 1.  
**Ammoniacal Salts, also Nitric Acid and Nitrates from Air.** 7,124. April 1.  
**Oils from Fish Refuse and other similar Offal.** The Fish on Syndicate, Ltd., and J. C. W. Stanley. 7,269. April 3.  
**Preparation of Double Sulphides of Aluminium, or Double Compounds of Aluminium with other Sulpho-metal or Metallic Salts.** D. A. Peniakoff. 7,273. April 4.

### ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

*Abstracts are specially prepared for the Chemical Trade Journal. RIGHTS of publication are RESERVED. This is the earliest abstracts of Chemical and allied patents accessible to the public.*

**Plants in Apparatus for Drying by Means of Furnace Gases.** F. D. Cummer, 1,051, East Madison-avenue, Cleveland, Ohio, Eng. Pat. 15,052. August 27, 1895.

The apparatus is designed to dry such substances as sulphate and soda, salt, lime, clay, etc., by means of the products of a furnace and heated air. The patent is purely a mechanical one, and in detail with the construction of the apparatus, which is known as the "Cummer" Dryer. There are eight drawings, showing the general and detailed construction of the apparatus, which, if the letterpress, must be consulted for further information.

**Plants in Apparatus for Sampling Gases for Analysis.** B. L. van der Meer, No. 15, Koningsplein, Amsterdam. Eng. Pat. June 1, 1895.

The apparatus is a bell is suspended over a pulley by a chain and balance so that it can be raised or lowered in a larger surrounding vessel filled with water. A conical float inside the bell keeps the gas apart. A small wash bottle is fixed on the top of the bell to show the rate at which the gas is passing. When working the bell is lowered until below the level of the water in the outer vessel, so that the gas is expelled. Additional weights are now added to those on the bell, with the result that the latter is slowly raised until the desired volume of gas is created. In this way the sample of gas can be taken at any desired speed, as indicated by the passage of the gas through the wash bottle, by regulating the weight added to the bell. To prevent the bell being raised so high as to become out of the water in the outer vessel, a stop plate is fixed to the side of the outer vessel, which catches the descending bell and arrests them. If a sample is wanted for analysis, the bell is removed, when the bell sinks with its own weight, and the gas is forced out through an exit pipe provided at the top. In this way a large and average sample can be automatically collected over a period of time, and a testing sample withdrawn at any time that is either convenient or convenient.

**Plants in Insecticides.** I. S. McDougall, 68, Port-street, Manchester, and I. S. McDougall, 10, Mark Lane, London. Eng. Pat. 9,535. May 14, 1895.

The invention relates to the attacks of insects in plant life, both indoors and outdoors, and remedies have hitherto been either in the form of washes or sprays. With washes, drought, or conditions of perpetual scarcity frequently make it impossible to properly supply a liquid over extended areas, such as hop gardens. To obviate this, it has been found to be distinctly advantageous to incorporate insecticides with a suitable absorbent, so that the whole can be applied as a powder. Various mixtures can be used, the following being cited as examples:—(a) 10% of tobacco extract and precipitated sulphate of lime; (b) extracts of tobacco and lac sulphur, dry soap, and kieselguhr; (c) arseniate of soda and extract of quassia, and finely powdered vegetable fibre.

## SOCIETY OF CHEMICAL INDUSTRY.

### MANCHESTER SECTION.

THE first business of the meeting of this section, which was held on the 10th inst., was the election of five members to fill vacancies on the Committee of the Section. During the counting of the votes the Chairman (Mr. George E. Davis) read a letter from Mr. Hargreaves, of Widnes, in which he extended an invitation to the members of the section to go over to Farnworth and see his electrolytic process for the decomposition of salt at work. The question of inviting the Society to meet in Manchester in 1897 was also brought before the meeting. The Chairman said it was now about ten years since the parent Society met in Manchester. This year the Society was meeting in London, and the Committee of the section thought that next year an invitation should be given to hold the meeting in Manchester. Dr. Schunk, of Manchester, had been invited to allow himself to be nominated as president for next year, and he had accepted the invitation. He moved that an invitation should be given for the holding of the 1897 meeting in Manchester. The motion was seconded by Mr. H. Grimshaw, and unanimously adopted. The scrutineers then announced that the ballot had resulted in the election of Mr. R. le Neve Foster, Dr. Gerland, Dr. Lewkowitsch, and Dr. Watson. Mr. R. J. Flintoff then read a paper on "The functions of albumen as a fixing agent for pigments on cotton," in which he stated that the functions were two-fold, viz., the well-known one of "occlusion" and the other that of increasing the opacity of the layer of colour, and at the same time increasing its reflecting power, thereby apparently increasing the colour of the body. The second of these two functions he named "intensification." The property of "intensification," he added, was not confined to albumen, but was possessed by many substances capable of holding pigments in a homogeneous state in suspension, and also of forming a suitable medium for their even distribution over the surface of the cotton fabric. Mr. Peter Hart described an apparatus for economising the waste steam from the air compressing engines in chemical works, and Mr. J. Barnes submitted a short paper on "The preparation of water free from ammonia," the outline of which has already appeared in the *Journal*, 456, p. 116. The next meeting will be held on Friday, May 1st.

## FIRE AT THE PENNSYLVANIA SALT MANUFACTURING COMPANY'S WORKS.

WHAT was a destructive and promised to be at one time a very severe fire occurred at the works of the Pennsylvania Salt Manufacturing Company, Natrona, Pa., U.S.A., on the evening of Saturday, March 21st. The plant covers some twenty acres of ground, and the different departments are so distinct from one another that it was possible to confine the fire to the smelting works, in which it originated, thus preventing any injury to the chemical branch. The investment represented by the entire works exceeds \$1,000,000, but the loss, instead of reaching that figure, as was stated in the Press despatches, will only reach about \$100,000. The fire originated in the copper smelting plant, to which it was confined by hard effort on the part of the company's own fire department and the assistance from the townspeople. The greatest loss was sustained through the melting of the tanks, in which gold and silver solutions were stored, and their escaping into the river. Some idea of this may be gained when it is said that 100,000 ounces of silver and 3,000,000 pounds of copper were produced monthly. This department consisted of a large number of frame buildings, covering an area of three acres, and which contained blast furnaces, smelting furnaces, and lead-lined tanks for storing the gold and silver solutions.

It is most fortunate for the company, as well as for its extended list of customers throughout the country, that no damage was done to the chemical works, and that their operations will be in no way interfered with. The daily output of this department is so extensive and is depended upon by so many other industries which employ the products of the Pennsylvania Salt Manufacturing Company, that the results of the fire would have been much more serious had it extended beyond the smelting works. There has, however, been no interruption to the usual prompt filling of orders for these goods, and special advices from the works advise us that the trade may be assured that there will be none. The work of rebuilding the burned portion of the works will be at once proceeded with.

THE NEW CONVEYOR CO., LTD.—About a year ago this company acquired the engineering works of Messrs. Stone Bros. and Co., Smethwick, Birmingham, and all the shops are now in full operation equipped with modern tools, a number of which are designed specially for the economical production of conveyors, elevators, and labour-saving machinery.

## THE LIFE WORK OF LIEBIG.

By A. HOWARD.

(Concluded from page 240.)

*Physiology.*—Liebig was very conscious of the vast importance of physiological studies, and at one time he even contemplated occupying himself with medicine; and, though this idea was never carried out, a great part of his life was devoted to efforts to advance medical science through physiology. His first work on animal chemistry constituted the second part of his report to the chemical section of the British Association in 1842. In it he traced the applications of organic chemistry to animal physiology and pathology.

Just as Lavoisier during the latter half of the previous century had laid the foundation of what may almost be called a new science, by the success with which he applied to chemistry methods that had long before been employed in physics—*i.e.*, the use of weights and measures—so Liebig aimed at applying the new and altered views that had been introduced into organic chemistry to the elucidation of the problems of physiology. Before Liebig directed his attention to physiology, physiologists had chiefly concerned themselves with the forms of organised bodies and of the phenomena of motion within them, whilst the study of the uses and functions of the different organs and of their mutual connection in the animal body had, to a great extent, fallen into the background.

A hundred and fifty years ago chemistry and physics had comparatively little in common. A hundred years afterwards it had become difficult to draw a line between them. Liebig looked forward to the time when chemistry and physiology would similarly be so fused together as to make it difficult to clearly separate the one from the other.

In spite of the almost universal reluctance of investigators before Liebig's time to abandon the idea that in biological processes all manifestations of chemical and physical action are in some mysterious way modified and overruled by a special vital force, Wöhler had weakened their hold on this idea by producing *urea* from mineral sources; Prout had observed the presence of hydrochloric acid in the stomach; Gurelin and Tiedemann had investigated the processes of digestion; Wöhler had observed that salts of organic acids in passing through the animal body are converted into carbonates, and many other isolated but valuable contributions to animal chemistry had been made.

Thus, when Liebig turned his mind to the study of the chemistry of physiology, he found a mass of facts ready to his hand, and a soil which was not unprepared to receive his ideas. It was therefore under auspicious conditions that he attempted the task of elucidating the action of chemical and physical laws in the life processes of animals.

The most interesting of all Liebig's teachings in physiological chemistry are doubtless those which deal with the relation of plants and animals to each other and to their environment.

Another interesting question which Liebig examined was that of the origin of the heat of the animal body. The temperature of every healthy human being is about  $98^{\circ}\cdot5\text{F.}$ , or  $37^{\circ}\text{C.}$  A human being in a state of rest loses enough heat in 24 hours to melt 66 pounds of ice, so that in the course of a lifetime one person produces heat sufficient to melt a small iceberg. Long before Liebig's time Lavoisier perceived the analogy between the processes of combustion and respiration; for both of them air is required, and by both of them carbonic acid gas is formed. Lavoisier and Laplace suggested that the heat evolved by the animal corresponds to the heat of combustion of the carbon and hydrogen of the food. Subsequently this was tested by experiment. The result showed that about 90 per cent. of the heat evolved by an animal can be accounted for in this way. Ten per cent. remained, which, it seems, could not have come from the combustion of the food. This result was accepted, and new sources of heat were suggested by nervous actions and friction within the animal organism. Liebig made fresh experiments on the subject, and became convinced that the whole of the sensible heat produced in an animal body could be accounted for by the processes of oxidation which occur within the organism. To-day the correctness of Liebig's decision is so completely established that it may be regarded as one of the truisms of science.

In some of his contributions to physiology Liebig discussed the classification of foods, and dealt generally with the chemistry of the food of animals. The components of plants on which animals feed include:—

1. The *non-nitrogenous* substances, carbohydrates and hydrocarbons.
2. The *nitrogenous* substances, the most important of which are the *albuminoids*.

Liebig's attention had been drawn to the similarity between the nitrogenous constituents of plants and animals, and on looking into the matter, he found that the two classes of substances closely corresponded in their chief properties. Now the graminivorous animals form a link between the plants and the flesh-eating animals, consequently this discovery threw light on the mutual relations of the plant and animal kingdoms in nature. Since vegetable albumin and fibrin are so little

different from animal albumin and fibrin, it seems to follow that produce the blood of animals. It is well known that nitrogenous stuffs are absolutely essential for animals. Liebig argued from facts that the animal organism gives to the blood only its form; is incapable of creating blood except out of substances which contain its chief constituents.

Liebig illustrated the importance of albuminous substances to life by calling attention to the changes in which a chick develops an egg. Both the white of an egg and the yolk are largely composed of albuminoids. When an egg has been impregnated, and when maintained at a suitable temperature by means of the oxygen of the air, it gradually develops all the parts of the animal body. In the end all the albumin disappears. Evidently albumin, he said, is the foundation of the whole series of tissues which constitute those which are the seat of vital actions.

Liebig divided foods into two classes:—

1. *Plastic foods*, nitrogenous substances. These serve to form and to build up the various organs of the body.
2. *Respiratory foods*, non-nitrogenous substances, fats and hydrates. These serve for the generation of heat.

For a long time this classification was generally accepted. Its classifications, however, it was imperfect.

It is difficult to draw the line between plastic and respiratory and physiology now teaches us that all varieties of food are assimilable and respiratory. But the value of a conception of the does not depend on its actual and final truthfulness; it depends on usefulness. A theory, as Liebig always taught, is only a tool.

It is found convenient to retain Liebig's classification of foods into nitrogenous and non-nitrogenous groups—the members of the groups exhibit marked differences in their effect on the organism. Nitrogenous foods are capable of sustaining animal life, though not usually advantageously. Non-nitrogenous foods, on the other hand, are quite incapable of sustaining life. Mineral salts, of course, are necessary in addition to these organic food stuffs.

In the last section of his "Chemistry of Food," Liebig dealt with the chemistry of cookery so far as concerns the use of flesh. Obviously, he pointed out, that if the flesh employed for food becomes again flesh in the animal body, none of the constituent flesh ought to be withdrawn from it in its preparation for the table.

The investigation of these matters leads us to Liebig's celebrated extract of meat. By boiling down extract of lean flesh in a water bath we can obtain "Liebig's extract of meat." This extract is not merely a useful stimulant, ranking perhaps with tea or coffee.

In concluding his contribution to domestic chemistry, Liebig dealt with the processes of salting and preserving meat. By collecting brine from a given piece of flesh, which had been pickled, he found that it corresponded to about  $\frac{1}{2}$  of the juice of the given piece. Analysing this brine Liebig discovered that it contained the constituents of soup. This explained why salt meat, when solely used as food, led to many disorders.

*Labours as a Teacher, etc.*—Liebig stayed at Giessen for 20 years. Speaking of his life there, he said afterwards, "It was as if Providence had led me to the little university. At a larger university, in a larger town, my energies would have been divided and dissipated. It would have been much more difficult, and perhaps impossible, to reach the goal at which I aimed; but at Giessen everything was concentrated in work, and in this I took passionate pleasure."

Liebig's own words give the best idea of the method of teaching adopted at Giessen:—

"Actual teaching in the laboratory was only for the beginning. The progress of my special students depended on themselves. I gave them a task, and supervised the carrying out of it, as the radii of a circle all their common centre. There was no actual instruction. I met from each individual every morning a report upon what he had done on the previous day, as well as his views on what he was engaged in. I approved or made my criticisms. Every one was obliged to follow his own course. In the association and constant intercourse with the others, and by each participating in the work of all, everyone progressed. Twice a week I gave a sort of review of the important questions of the day; it was mainly a report of my own work, combined with the researches of other chemists."

"We worked from break of day to nightfall. Dissipations and amusements were not to be had at Giessen. The only recreation which was continually repeated, was that of the attendant, who was not get the workers out of the laboratory in the evening, and wanted to clean it."

"The remembrance of this sojourn at Giessen awakened in my pupils an agreeable sense of satisfaction for well-spent time."

"The production of organic preparations was an object to which I gave very particular attention; it is very much more important than is usually believed, and one can more frequently find men who can make very good analyses than such as are in a position to produce organic preparations in the most judicious way. The formation of a prep-

and, at the same time, a qualitative analysis; and there is no y of making one's self acquainted with the various chemical s of a body than by first producing it out of the raw material converting it into its numerous compounds and so becoming ed with them."

ere the methods adopted for teaching chemistry at Giessen. re justified by the results obtained.

y remains to indicate Liebig's influence on the progress of

erations pass away, and the deeds and capacities of great men be truly estimated, it will be found that the name of Liebig position very close to those of Lavoisier and Dalton, the leaders in our science. It is not as the author of the 317 tions, the titles of which fill the pages of the Royal Society, nor as the great originator of a scientific physiology and re, nor again as the writer of numerous handbooks, that Liebig most for science; his greatest influence has been a personal t is to him that most chemists now living indirectly owe their existence. The Giessen Laboratory was the first one in which ce was truly taught, and from this centre the flame of original was carried throughout all lands by ardent disciples, who more cessfully continued, both as regards tuition and investigation, ter's work.

paring this account of Liebig's work, I have freely made use sources of information at my command. In particular, I knowledge the assistance I have derived from Mr. W. A. e's admirable work on Liebig, to the pages of which I would those who wish to make themselves more familiar with the he great German chemist.

## Reports of Companies.

### THARSIS SULPHUR AND COPPER COMPANY.

directors of the Tharsis Sulphur and Copper Company, nited, in their report for the year ending 31st December, 1895, om the Tharsis mines the mineral extracted during the year 278,441 tons, against 335,896 tons in 1894, a decrease of ns. From the Esperanza deposit 226,249 tons of schist were , against 315,077 tons in 1894, the quantity of schist remain- is deposit available for profitable working being now of limited

From the Calanas mines the mineral extracted weighed ns, against 254,531 tons in the previous year, an increase of ns. At Calanas operations of a special kind are being prosecuted, which it is anticipated will have valuable results mediate future. A considerable extension of the open cast is being made to the westward, necessitating, in the first a heavy removal of overburden. This is being accomplished enditure unprecedentedly low for this kind of work, and as it a large quantity of mineral of good quality will be made . There has also been in course of construction during the

ew reservoir or dike, to provide much needed additional for water. It is now almost completed, and will increased quantities of the ore less suitable for export eated on the spot. At Lagunazo mines the extraction as now been fairly commenced, 35,618 tons having been of a quality thoroughly satisfactory in regard to its copper , and the directors look forward hopefully to the further ent of this mine, which is proving a valuable addition to the of the company. The total quantity of mineral raised at all s during the year has been 612,483 tons, against 588,427 tons -an increase of 24,056 tons. Both for export and for local t the quantities raised have exceeded those of the previous The production of copper at the mines has this year been the t the history of the company. This satisfactory result has been measure due to the abundant supply of water all through the e rainfall having been very favourable. At Tharsis it 141'35 inches, and at Calanas 34'51 inches, against 25'26 and es respectively for the previous twelve months. So far as nt year has gone the water supply has been ample, and as the reservoirs are well filled there seems no reason meantime to id any scarcity of this important element. The working costs to compare favourably with those of previous years. In ection careful economy is practised, while thorough efficiency ined; and every attention is given to whatever may, in any tribute to the successful working of the mines. The railways s have been kept in efficient working order, and during the railway revenue has benefited by an increase in public traffic. ments of pyrites in 1895 were 197,832 tons large mineral, 22,996 ll, and 6,001 tons of washed mineral—in all, 226,829 tons against 209,240 tons in 1894, an increase of 17,589 tons. Of precipitate 9,443 tons were shipped, against 7,386 tons in the

previous year. The metal works have done a large amount of profitable work during the year, the refined copper produced having exceeded last year's quantity by nearly 1,200 tons, this increase having been mainly due to the larger shipments of precipitate from the mines. Valuations have received attention, and from "mines in Spain" there has been written off for Tharsis and Calanas the sum of £20,000, and for Lagunazo £3,690. os. 5d. The sum of £20,000. has also been written off the amount standing against railways, rolling stock, and shipping piers, apportioned rateably over these assets. The net profits for the year, together with the balance of £14,948. 2s. 9d. brought forward from 1894, as shown by the profit and loss account, amounted to £234,439. 3s. 2d.; and the directors recommend (1) that the sum of £218,750. be appropriated to the payment of a dividend of 7s. per share, equal to 17½ per cent. on the capital of the company, free of income-tax, payable on or after Friday, the 8th day of May next; and (2) that the balance of £15,689. 3s. 2d. be carried forward to the credit of the year 1896. During the year the directors elected Mons. E. J. Desmarest, banker, Paris, to fill the vacancy caused by the death of Mons. Barthelemy St. Hilaire, and the retiring directors at present are Mons. Desmarest, Mons. D. M. Messera, Mr. Hugh Brown, and Mons. Louis O. Schmidt.

### THE AUSTRALIAN GOLD RECOVERY CO., LTD.

The ordinary general meeting of the shareholders of this Company, Limited (MacArthur-Forrest Process), was held recently at the Cannon-street Hotel, E.C., under the presidency of Mr. Robert Smith, J.P. The chairman in the course of his speech said:—There is no doubt that the litigation in connection with the patents has materially interfered with the progress of our work throughout Australia; but it looks as if our troubles are nearing an end. As you are aware, the judgment of the Court of Appeal in England has materially strengthened our position, and we have taken steps to amend our patents on the lines therein indicated. We have already secured the amendment of our patents in Queensland, West Australia, South Australia, and Tasmania, and have lodged our applications for Victoria and New South Wales. Our position is further strengthened by the recent powerful American decision in connection with the Gold and Silver Extraction Company of America, which holds the kindred patents for the United States, and which I will now read to you:—"Substance of decree in case Gold and Silver Extraction Company of America, Limited, against Mercur Gold Mining and Milling Company, adjudged and decreed that letters patent to MacArthur-Forrest, May 14, 1889, for improvements in process of obtaining gold and silver from ore, and patent to MacArthur, December 24, 1889, for improvements in metallurgical filter, are good and valid; that plaintiff is entitled to exclusive right in and under said letters patent; that the entire title to said letters patent is vested in plaintiff; that defendant infringed said patents by using same conjointly, and that defendant be enjoined and restrained from using, directly or indirectly, said patents, or either of them, or any process or improvement similar to them or either of them, and from imitating same or either of them during the term of said letters patent. Court not in session until next Monday, when decree will be entered." A stronger decision than this could not have been invited, and you all know the weight which an American decision carries all over the world on patent questions.

### THE CHESHIRE SALT TRADE.

THE returns for the past month show that the shipments have been of anything but a satisfactory character, and the same may be said regarding the returns for the first quarter of the present year. This is apparently chiefly owing to the short shipments to the East Indies, and that none of the other markets have been brisk. The shipments for March amount to 27,050 tons, against 8,059 ten years ago. The average for the ten years has been 49,977 tons. During the three months in 1896, the shipments were 89,940 tons, against 104,057 in 1895, which was the smallest amount in the previous ten years, for in 1887 the figures were 200,940 tons. The shipments last month from Liverpool were 20,705; Runcorn and Ship Canal, 3,630; and Weston Point, 2,712; total, 27,050. The tonnage of rock salt from the same ports was—Liverpool 2,861, Runcorn and the Ship Canal 173, and Weston Point 590; total, 3,624 tons. The upper Mersey ports have shipped more than last year, the Ship Canal having furnished several good-sized vessels for America.

RECENT CONTRACTS.—The following tenders have been accepted by the Barrow-in-Furness Corporation, for the gas department:—Wrought iron tubes and fittings, Messrs. Lloyd and Lloyd; brasswork, Messrs. J. Russell and Co., Limited; main pipes, the Stanton Iron-works Company, Limited; sulphuric acid Messrs. J. Riley and Sons, Limited; lime, the Craven Lime Company, Limited.

## Our Book Shelf.

**PETROLEUM.** By Herberton Redwood and G. T. Holloway. 2 vols., 1000 pp., including index, numerous illustrations, maps, and plates. London: Charles Griffin and Co., Ltd. 1896. 45s.

This voluminous and excellently got up work deals with the geological occurrence and geographical distribution of petroleum, its physical and chemical properties, uses, and in short with petroleum and all petroleum products of all kinds.

The first volume deals most exhaustively with the occurrence and distribution of the oil and oil gas, and describes the conditions peculiar to all the countries where these two are found. The physical and chemical properties and theory of origin are then dealt with, after which is given a detailed and most interesting account of the various methods of being set on as practised in the States, Canada, Russia, Galicia, and elsewhere. The refining of petroleum next receives attention, and it is here that the hopes raised by the extensive treatment of the preceding sections are disappointed. Out of the 400 and odd pages in the volume there are but 12, and 12 only, devoted to the subject of petroleum refining in that greatest centre of this industry—the United States. The introductory section, which has been so interestingly expounded in the earlier sections, is virtually condensed down to the statement that “The refining of petroleum in the United States is monopolized by the Standard Oil Co., who own a considerable number of refineries.”

The second volume opens with a description of the Scotch and English oil industries. Section viii. is an important one, as it deals with transport, storage, and distribution. The chief American oil states are described individually, but the opening portion of this section is very deficient in detail. The great Tide-water pipe line and its exciting history is disposed of in less than three lines. The extension of the independent United States (Emery) line to Wilkesbarre is recorded, but nothing is said concerning the extent of its extension, while the almost startling step made by “one of the lines” (it was the same independent Emery line) by being refined instead of crude is related in a dozen words. The descriptions of the methods of testing petroleum are good, and the account of the various flashpoint apparatus is not only most complete but very interesting. Under the heading of lamp accidents there is nothing new, and much that is more than debatable; in fact this section is almost word for word the same as that written by the author and published last year in another well-known work on chemical technology. It is most surprising that such an authority should continue to repeat some of the statements in this section. The book concludes with a summary of the petroleum laws, which will be found very useful for reference. For the United States, however, better information can be obtained from a very similar, but in some points more comprehensive, compilation of the American laws that has recently been published. The work is splendidly got up, excellently illustrated, and affords a valuable review of the petroleum industry as a whole; but we regret that a careful study of the work reveals the fact that, although full of information about the Russian, Galician, French, and other industries, there is little if anything fresh to be learned about the oil industry in America—the centre of production.

**BLEACHING AND CALICO PRINTING.** By G. Duerr, assisted by W. Turnbull. 142 pp. and index, with diagrams and over 100 dyed and printed patterns. London: Chas. Griffin and Co., Limited. 1896. 12s. 6d.

This book (though virtually the text of a course of lectures delivered by the author to a class of students) is in no wise what may be politely termed an examination handbook. It is essentially a practical work describing technically all the processes of bleaching, printing, mordanting, and dyeing, as well as dealing with the kindred subjects of mineral and coal-tar colours, thickeners, and the properties and testing of the oils, soaps, and solvents used in these industries. The work abounds in recipes and formulæ, and in this connection chapter iv., on styles of calico printing, calls for special comment, while the same may be said of chapter xii.

The method given for testing bleach in conjunction with the sections on the testing of water, soaps, and glycerine leave room for improvement, as in a technical work of this kind it is desirable that such matters should either be dealt with more fully and technically, or else be disposed of wholesale by reference to standard and technological works wherein these questions are ably handled. This protest, however, should not detract from the excellency of the work in general, which is essentially devoted to the bleaching and textile printing industries, as a first guide and help to the mastery of which it would be hard to find a better. There should soon be an opportunity for amending any small defects in a second edition.

## THE USE AND PREPARATION OF BORDELAISE MIXTURE.

THE mixture composed of sulphate of copper, lime, and water generally known under the name of “Bouillie Bordelaise” has for some time already been employed as a preventive against mildew and other cryptogamic diseases of the vines in France and other countries, has of late years begun to be used for combating these diseases amongst other plants and among vegetables, and it is now employed very generally as a preventive against the pernicious and often very calamitous potato disease in many parts of the world.

Though many persons, therefore, in the United Kingdom doubtless already acquainted with the composition and preparation of the “Bouillie Bordelaise,” there may still be a number to whom the following remarks may be of use; and observations regarding an improved “Bouillie Bordelaise,” recommended to be employed in exceptionally serious instances of cryptogamic maladies, may be of some interest to all classes engaged in agriculture.

The following is the composition of the “Bouillie Bordelaise” used now in the Bordeaux district (and as recommended by the national Viticultural Congress held at Rome, 1889, and competent authorities):—

|                          | French<br>Weights and<br>Measures. | English<br>Weights and<br>Measures. |
|--------------------------|------------------------------------|-------------------------------------|
|                          | Kilograms.                         | Lb.                                 |
| Sulphate of copper ..... | 1.500                              | 3                                   |
| Lime .....               | 0.500                              | 1                                   |
|                          | Litres.                            | Gall.                               |
| Water .....              | 100                                | 2                                   |

The general directions for preparing the “Bouillie Bordelaise” follows, viz.:—

The requisite quantity of water should be poured into a tub or other suitable receptacle (e.g., an old cask standing upright) it should be placed the sack or basket containing the quantity of sulphate of copper, in such a way as to immerse entirely in the water; after immersion, during about two hours sulphate of copper will be found to be dissolved.

In another receptacle (this is essential), made of wood, should be placed the requisite quantity of lime, and upon it a proportion of water should be poured, gradually tempering it, obtain a fairly thick lime-wash. Care should be taken to lumps and pieces; and the small stones and other impurities choke up the implements of aspersion) should be taken out.

This lime-wash should, thereupon, be poured slowly solution of the sulphate of copper, the mixture being stirred time to time with a bundle of small well-cleaned wooden sticks being taken that no part of these sticks (bark, etc.) shall fall into the mixture.

In this way a clear “Bouillie” of a fine blue colour obtained which, after being left to settle, will deposit a bluish sediment at the bottom of the receptacle; but every time that it is used (i.e., that the implements of aspersion are filled with it) the sediment should previously be thoroughly stirred up again.

It should be noted that whenever the said “Bouillie,” being blue is of a greyish colour, the reason is that the preceding operations have not been properly carried out, but that the lime dissolved in water taken from the receptacle used for dissolving sulphate of copper; and in such case the “Bouillie” should be used, as it is good for nothing.

The “Bouillie Bordelaise,” prepared according to the above directions, should be applied, if possible, in fine weather, but there be danger of mildew, &c., appearing, then the mixture should be applied without loss of time, that is to say, without waiting for weather.

The best implements of aspersion for sprinkling the “Bouillie” upon the leaves of the plants are those which throw the spray in strong jets (from above) in the minutest possible most numerous possible drops, so that the mixture may fall foliage like a fine but dense shower of rain. For it must be remembered that only those parts of the leaves are impervious to cryptogamic diseases which are touched by the mixture.

Inasmuch as the efficacy of the treatment of the plants with “Bouillie Bordelaise” depends, to a great degree, upon the quality of the sulphate of copper used in its preparation (in which respect it may be observed, the maximum amount of impurities not exceed five per cent.), it is advisable, before using it, to test the quality of the sulphate of copper in the following manner:—Dissolve a small sample into powder, a minute portion of which should be dissolved in a tumbler of pure water, and to this added a few drops of ammonia. If the sulphate of copper is

will be perfectly clear, and of a fine blue colour. (It may, however, be observed that, inasmuch as sulphate of copper, as sold in trade, is absolutely pure, the addition of the ammonia generally produces a slight cloudiness at first, but this may be regarded as of no account.) If, on the other hand, the sample of sulphate of copper contains sulphate of iron, as is sometimes the case, then the solution made above mentioned will at first assume a muddy, dark blue colour, but gradually become clearer; eventually, a flaky greenish-black precipitate will be deposited at the bottom of the tumbler, and the liquid above the same will assume the fine blue colour of pure sulphate of copper. In such case the sulphate of copper should not be used in the preparation of the "Bouillie Bordelaise," for it would not possess the qualities requisite for destroying the germs of cryptogamic diseases. Though the valuable utility of the "Bouillie Bordelaise" and its use, when judiciously applied, is now generally acknowledged, it is, nevertheless, to have been found by some prominent agriculturists in France that, when the invasions of mildew and similar diseases are of an unusually virulent character, the preventative use of the mixture as prepared at present (in the above described form) is not of a sufficiently vigorous nature for such exceptional cases.

According to a communication lately made to the Agricultural Society of France by Mr. Michael Perret, one of its leading members, the use of this limited efficacy must be ascribed to the fact that the mixture is applied to the vines or other plants in the form of an almost insoluble precipitate of oxide of copper, and that it is, accordingly, unable to act very slowly in consequence of its restricted solubility. Could the solubility of the oxide of copper be enhanced by increasing the proportion of sulphate of copper now used in preparing "Bouillie Bordelaise," as described above.

Hereto, observes Mr. Michael Perret, the augmentation of the active action of the oxide of copper has, it is true, been attained, to a certain extent, by the addition of acids or of ammonia. But, though only these substances have had the effect of dissolving the oxide of copper, the chemical compounds obtained by such process have, it is to be noted, the serious disadvantage of destroying a portion of the delicate tissue, and especially that of the tender young leaves, to which the same may be applied.

It must, therefore, be considered highly desirable that a substance should be found which, while acting as a thorough solvent, causes no damage to the plants; and Mr. Michael Perret asserts that the substance fulfilling both of these conditions is *sugar*, the salt in which the (when used in the "Bouillie Bordelaise") forms a component part, being a double saccharate of copper and of lime. This salt is formed by mixing saccharate of lime with sulphate of copper, the reaction being facilitated by a two-fold decomposition, viz.: By the sugar acting with the copper and the sulphuric acid with the lime. In the process the sulphate of lime falls as a precipitate, whilst the saccharate of copper appears as a bluish-green liquid, which will be found to contain about 50 per cent. of the copper, the other half being combined with the sulphate of lime.

When applied to the plants, this solution of copper (mixed with the saccharate of lime) will be found to exercise an immediate action upon the leaves; whilst a slower, that is to say, continuous action, will be exerted by the precipitate which remains upon the plants. For it has been found (according to Mr. M. Perret's statement) that this "Bouillie Bordelaise" is a very adhesive mixture, and when applied upon the plants is able to resist the effects of rain, owing to some peculiar quality of saccharates, or (what Mr. Perret is more probable) to the fact that the copper, being able to penetrate the tissue of the leaves, is thus protected from the action of rain. Whatever may be the reason, it has at all events been proved, by conclusive experiments made by Mr. Aimé Girard, a well-known French chemist, that the almost entire quantity of the copper contained in the "Bouillie Bordelaise Sucrée," made according to the directions of Mr. Michael Perret, has been found upon the plants upon which the mixture has been sprinkled in a judicious manner.

Mr. M. Perret states that he has now, for many years, exclusively employed this sweetened mixture, and with it has fully succeeded in eradicating all cryptogamic diseases amongst vines, vegetables, etc., without in any way injuring the plants in question. This "Bouillie Bordelaise Sucrée" may be applied with equally good results to potatoes as to vines and other plants; and it is more particularly in the case of its application as a remedy against the potato disease that the adhesive properties of this mixture have been fully established, as above described.

It must, however, be observed that the preparation of the "Bouillie Bordelaise Sucrée," of the double saccharate of copper and of lime, above mentioned, is a somewhat delicate matter. For, on the one hand, it is essential that the proportion of the several ingredients composing the mixture must be very exactly maintained; on the other hand, the materials to be used for it frequently vary in quality or composition, and the lime is often more or less calcined, and the limestone from which it is taken more or less pure.

In order to overcome these difficulties, Mr. Michel Perret gives the following directions for the preparation of the "Bouillie Bordelaise Sucrée," viz. —

A mixture, consisting of 2 kilos. (4 lbs.) of ordinary molasses—as can be obtained in sugar refineries—and of 2 kilos. (4 lbs.) of lime, in the form of paste, of a maximum hydration, to be boiled and stirred, and then poured out upon a level surface. When cooled and solidified, this mixture, which will have the appearance of solid varnish, should be left to dry, and then be reduced to powder. When in the latter form it should be mixed with 1 kilo. (2 lbs.) of powdered sulphate of copper. Three kilos. (6 lbs.) of this powdered mixture, mixed with 100 litres (22 gallons) of water, constitute the "Bouillie Bordelaise Sucrée."

It may be added that Mr. Michel Perret offers to sell sample bags of the above described powder, prepared by him (at about 16s. per bag of 24 lbs.) for trying the efficacy of his remedy; and he states that three aspersions made with this mixture (the first at the commencement of vegetation) ought to suffice towards protecting the plants against the most virulent invasion of cryptogamic diseases.

### IMPORTS AND EXPORTS FOR MARCH.

AS a whole the Board of Trade returns for the past month show a satisfactory improvement in trade. Certain individual articles of interest to the chemical trade do not appear to share in the general betterment. In the imports petroleum and turpentine are much reduced both in quantity and value. The quantities of paraffin, rosin, and tallow were less, but of india-rubber and nitrate of soda more. In exports, alkali and salt still show a falling off.

#### IMPORTS OF FOREIGN AND COLONIAL PRODUCE.

**GOLD OUTPUT IN THE RAND**—Owing to the split in the Chamber of Mines, there has been some difficulty in ascertaining the actual total for March. It now appears that the return given by the old Chamber was wrong by about 5,000 ounces, as the production of the mines in the new Chamber was only estimated. Thus while the March total is now returned by the old Chamber of Mines as 147,015 ounces. The new Chamber, consisting of Langlaagte Estate, Block B, Van Ryn, George Goch, Meyer and Charlton, Princess Estate, and United Main Reef, returns 26,937 ounces, making the total for the month 173,952 ounces, as compared with the first estimated total of 179,153 ounces. The formation of the new Chamber arises out of the opposition to leading groups here by Robinson and a section of the German group. Of the total number of companies which have joined the new Chamber (26) only seven are producers. The old Chamber comprises the remainder of the industry.

### THE MERSEY SALT SHIPMENTS.

THE monthly and quarterly return of salt shipments from the Mersey, issued by Mr. H. E. Falk, is, on the whole, not of a very encouraging description. The return shows that trade is dull, and shipments for March have been somewhat disappointing. To particularise it may be pointed out that there is an enormous falling off in the export to the East generally. The shipments to Calcutta, for instance, were 3,634 tons in March, compared with 13,582 tons in March, 1895, while for the first three months of the year the figures are 12,977 tons, against 24,894 tons in the first quarter of 1895. The falling off in the March shipments to Burmah are proportionately large, being 606 tons, compared with 3,081 tons in March last year. The quarter's returns are somewhat better, being 2,706 tons in the first quarter, against 3,916 tons to March, 1895. Decreases are shown in the March shipments to Australasia, Africa, the West Indies, to Europe generally, and to the other ports of the United Kingdom, while increases, such as they are, are shown to the United States, Central and South America, and to British North America, the figures in this last-named instance being very satisfactory, both for March and for the whole of the quarter. Decreases on the quarter's shipments, compared with the first three months of 1895, are shown to the United States, Asia (as already pointed out), and Australasia, whilst increases are shown to the West Indies, Central and South America, Africa, Europe, and to the other ports of the United Kingdom. The total shipments from Liverpool in March amounted to 23,547 tons, against 35,093 in March, 1895, and for the past quarter to 60,053 tons, compared with 67,631 tons in the first three months of 1895. The shipments from Runcorn and Weston have materially increased, being 6,989 tons last month, against 5,285 in March, 1895, and 12,539 tons for the past quarter, compared with 6,410 tons last year. The total shipments of salt from the Mersey therefore were 30,536 tons last month, compared with 40,378 tons, and for the quarter 72,592 tons, against 74,041 tons.

### THE SICILIAN SULPHUR INDUSTRY.

THE measures proposed by the Italian Government for the relief of the sulphur industry of Sicily lend interest to a report by the United States Consul at Catania, on the present condition of the Sicilian sulphur mines and miners. The industry is now in a deplorable state, owing to overproduction and low prices. Numerous conferences have been held in different towns in the island to devise remedies, but so far without result. The last suggestion was to form a kind of sulphur union of all the mines, which should regulate the production and export. The Consul, however, does not see how the production can be reduced; for the mines must be worked if only to keep out the water, which accumulates rapidly and would soon ruin them. Moreover, there is a great need of money amongst the mine owners. The proposition which appears to have found favour with the Government has been the establishment at the ports of warehouses, where certificates should be issued for the sulphur deposited, which certificates might be discounted by the banks. In addition, a reduction of the export duty, which amounts to about 8s. 6d. per ton is asked. The price of sulphur has fluctuated considerably, that for "best thirds unmixt" having been as follows in the respective years per ton:—1876, 120 lire (lire=9½); 1879, 97 41; 1884, 89; 1886, 76 20; 1891, 115 59; 1895, 55 lire. The wages of the miners have necessarily gone down with the prices, so that now they have fallen to 3½d., 4d., and at most 5d. per day. For many years the quantities mined have largely exceeded those exported, and in 1894 and 1895 the excess was over 300,000 tons. The report of great sulphur deposits having been found in Louisiana, and of plans for working them, has naturally added to the depression in Sicily. So backward is the industry in other respects that the fusing of the sulphur in the primitive furnaces can only be done at certain times of the year after harvesting the crops, which would be ruined by the fumes. The modern works at Catania can, of course, continue all the year round.

**MINERAL OIL INQUIRY.**—The committee of inquiry upon the petroleum laws met again on Wednesday, under the chairmanship of Mr. A. J. Mundella, M.P. Mr. Alfred Spencer, of the London County Council, gave evidence showing that in the great proportion of lamp accidents the reservoirs were broken and the oil escaped and ignited, and in no fewer than 443 cases the reservoirs consisted of glass and china, and in only eight of metal. In 196 cases the lamps had exploded. In every one of these cases it was found that a channel of communication existed between the reservoir and the flame. In only 200 cases out of 876 accidents had it been possible to ascertain the nature of the oil used, and in comparatively few cases only had it been possible to obtain samples. In his opinion very few of the accidents would have occurred if any very high test oil had been burning in the lamps.

### NOTICES.

#### LONDON AGENTS

Booksellers and Newsagents may now obtain supplies of  
"THE CHEMICAL TRADE JOURNAL"

From

MR. JOHN HEYWOOD,

2, Amen Corner,

On usual trade terms.

Paternoster Row, E.C.

#### FOREIGN REMITTANCES.

Owing to the inconvenience created by the various ways in which foreign subscriptions are remitted, we respectfully beg to inform subscribers that a *Crossed MONEY ORDER* is the most satisfactory method of remitting, both for them and ourselves. In the case of a Money Order, a letter advising us of same should always be sent, otherwise, owing to post-office formalities, much delay in tracing and acknowledging foreign remittances is inevitably entailed in this country.

### Market Reports.

#### TAR AND AMMONIA PRODUCTS.

Benzol is easier, and not moving very well at the reduction, 90's now being quoted 2s. and 50/90's 1s. 8d. For July-December delivery 90's are quoted 1s. 10d. There is practically no change in the other products. Crude carbolic acid is perhaps a shade easier, but the difference is hardly quotable. Crystals (40%) remain at 8d. Solvent naphtha steady at 1s. 3d., and crude at 9d. Pitch is quiet at 33s. f.o.b. East Coast.

Sulphate of ammonia continues to droop. Owing to the absence of large buying for April delivery, makers are anxious to be clearing off their stocks, and prices therefore are again lower. Beckton is quoted £8., London outside makes £8., Liverpool £7. 17s. 6d., Hull £7. 16s. 3d., and Leith £7. 15s. to £7. 16s. 3d.

#### LIVERPOOL MINERAL MARKET.

The market this week has been brisk. Manganese arrivals continue very limited, and these are sold for forward delivery, hence stocks in the meantime have been so drawn upon that they are practically nil; prices are considerably firmer for both prompt and forward delivery. Ground manganese is in increasing demand at higher prices on account of the scarcity of the raw material, viz., £8., £10., £12., and £15 per ton, according to quality. Manganiferous iron ore: Though arriving freely, prices are improving. Chrome ore: Arrivals have been larger, but prices are steady without any material alteration. Bauxite is in good request, and sells freely at 20s. for first, 16s. for second, and 12s. for third quality, f.o.b. French chalk: Notwithstanding unusually heavy arrivals the demand continues good, and prices are unaltered—"Angel White" brands are in special request at 65s. to 70s., 80s. to 90s., and 100s. to 110s. per ton, according to grade. Wolfram and scheelite: There are no arrivals to report, whilst stocks are considerably reduced, and prices are very much firmer. Ferro-tungsten and ferro-chromium are in good demand at last quotations. Arsenic: The production is very limited, and the demand is strong; prices are therefore advancing by leaps and bounds—£27. to £30. per ton now being quoted. Fuller's earth is steady at 50s. for lump, 55s. for ground, and 75s. per ton for impalpable powder, "Emerald," and other brands. Ochres and umbers are in steady demand without alteration in price. Antifriction ore is unaltered. Pumice-stone: There is more inquiry for lump, very fine Teneriffe lump being done at £7. 10s. per ton, and Italian at £10. 10s. per ton. Keiselguhr is in good demand, and brings full prices. Asbestos and mica steady, high-class qualities are being inquired for. Bog ore: Stocks are low, and as the shipping season has not yet commenced, prices are firmer at 20s. to 25s. per ton. Magnesite sells slowly at somewhat lower prices. Plumbago: Founders' and lubricating qualities are in good demand at £6. 10s. to £10. per ton; prime Ceylon being done at £15. to £20. per ton, according to grade. Carbonate and sulphate of barytes: There is more offering at somewhat lower figures. Molybdenite, cerite, euxenite, orthite, etc., meet with a quiet demand.

#### MISCELLANEOUS CHEMICAL MARKET.

There is little change to report in the general condition of the market in regard to alkalis. A fairly steady business is being done in all the main products, both for export and home trade, and prices are on the whole steady. Caustic soda remains at figures given last week.

o.b. Liverpool, 77%, £9. 7s. 6d.; 74%, £8. 7s. 6d.; 70%, 6d.; 60%, £6. 7s. 6d. per ton, 10-ton lots and upwards. Soda alkali, 58%, £3. 7s. 6d., bags, f.o.b. makers' works. Soda 35s. per ton, bags. Leblanc ash, 1d. to 1½d. per degree, f.o.b. Bleaching powder steady at £6. 17s. 6d. to £7. 2s. 6d., and £7. 5s. hardwoods, f.o.b. For some markets special concession has been made. Chlorate of potash 4½d., d. per lb. Sulphate of copper is steady in price, at £17. 10s. 15s., according to make. Saltcake generally firm, at 22s. works, Lancashire and Cheshire, and higher prices in other

For potash, caustic and carbonate, the demand continues and prices are firm. Brown acetate of lime still offering at low prices, owing to pressure of stocks upon the markets. Estates generally are quiet. Acetic acid has a tendency to little in price. In nitrate of soda the market is steady, at 8s.

White powdered arsenic is still deficient in supply, and ruling from £23. to £24., according to time of delivery. Salt and oil are weak in price. For carbolic crystals the market is easier. This is looked upon as only temporary. There is a demand for green coppers, and with the increased scarcity is firmer in all districts. Prussiate of potash weak, at 7¼d. per lb. Cyanide, 1s. 2½d. to 1s. 3d. per lb. Sulphocyanides quiet, and prices steady. Muriate of ammonia rather easier, 6s. to £22. For chemicals generally there is as yet no marked

### REPORT ON MANURE MATERIAL.

market continues quiet, but there has been a fair amount of done for prompt and early delivery. The quotation for Florida phosphate rock remains at 6d. per unit, in cargoes c.i.f. Kingdom ports, and that for South Carolina River rock at 5½d. 1896 steamer shipment. There is no business to report in bone bones, but £3. 17s. 6d. per ton would no doubt be for summer-autumn shipment. For Bombay bone meal the market is rather easier. On spot, £3. 17s. 6d. would be accepted, except for shipment there are sellers at £3. 15s. Sellers ask £4. for crushed Kurrachee bones on spot, but do not find at the price. Quotation for shipment is £3. 17s. 6d.

Nitrate of soda remains firm, at 8s. per cwt. for fine quality. Due cargoes ordinary quality are worth about 7s. 10½d., per-autumn shipment 8s. 3d. to 8s. 4½d. per cwt. Home-dried blood offers at 7s. 6d. per unit, free on rails at works.

### WEST OF SCOTLAND CHEMICALS.

GLASGOW, TUESDAY.

are no signs of recovery in sulphate of ammonia as yet, but reverse in this part of the market. The present procurable is at above £7. 17s. 6d., at which a few transactions continue to go through, but buyers are not at all eager. It seems that at parcel was sold at £7. 16s. 3d., but that was, on the part of going lower perhaps than need be, so far at least as last is concerned. Forward business is not so much as hinted at. Chemicals market shows moderate signs of improvement, not as yet to the extent of any rise worth mentioning. Chlorate is firmer a little, and the feeling in soda ash, soda crystals, is a bettering one, without positive change of value. Oversea inquiry is being felt beneficially. In mineral oils there is increased call for lubricants, the prices of which are well

prices current are:—Soda crystals, £2. 2s. 6d., nett, Tyne; 48/56°, £3. 15s. to £4. 15s. nett, Tyne; white alkali, 4. 10s. to £5. nett, Tyne; alum in lump, £5. to £5. 5s. nett; caustic soda, white, 74° £8. 7s. 6d., 70/72° £7. 7s. 6d., 60/62° £6. 7s. 6d., and cream 60/62° £6. 7s. 6d., all nett, Liverpool; bleaching £7. nett, Tyne; saltcake, 23s.; borax, English, £20., and boracic acid, £30. nett, Glasgow; bicarbonate of wt. casks, £6. 10s., and 1-cwt. casks £6. 15s. nett, Liverpool; te of potash, 4½d. nett, for Scotch and English deliveries (for ¼d. nett, f.o.b. Glasgow); bichromate of soda, 3¼d. nett, for and English deliveries (for export, 3½d. nett, f.o.b. Glasgow); of potash, 5d. less 5%, Liverpool; nitrate of soda, 8s. to 8s. 3d.; of ammonia, £7. 16s. 3d. to £7. 17s. 6d. prompt, f.o.b. Leith; niax, first and second white, £39. and £37. nett, any port; of copper, £8. 10s. less 5%, Liverpool; paraffin rd, 1½d. and soft, 1½d. to 1½d. per lb.; paraffin wax, 120° red, 2½d. to 2½d.; paraffin spirit (naphtha), 7d. per paraffin oil (burning) No. 1, 6½d., and crystal, 6¼d., at works, buyers (English sales about ½d. lower); ditto (lubricating)

865° £5., 885° £5. 10s. to £6., and 890/895° £6. to £6. 10s. Week's imports of sugar at Greenock were 26,000 bags cane, and 3,640 bags beet, all unrefined.

### THE METAL MARKETS.

LONDON, WEDNESDAY.—Pig iron, dull: Scotch warrants closed at 46s. 5d.; Middlesbrough, 38s. 1d. cash, and hematite, 48s. 3d. Copper, steady: Chili bars, G. O. B.'s and G. M. B.'s, closed at £44. 11s. 3d. to £44. 16s. 3d. cash, and £44. 16s. 3d. to £45. 1s. 3d. three months. Tin, easier: Straits closed at £59. to £59. 10s. cash, and £59. 12s. 6d. to £60. 2s. 6d. three months; Australian, £60. English ingots, £63. 5s. Lead, quiet: Spanish, £10. 18s. 9d. to £11.; English, £11. 2s. 6d. to £11. 3s. 9d.; Silesian spelter, ordinary, £15. 12s. 6d. Nickel, 1s. 2½d. Antimony, £30. to £30. 10s. Quicksilver, quiet: first hands, £6. 17s. 6d.; second hands, £6. 16s. 6d. Copper shares, steady: Cape, 2½ to 2½; Copiapo, 1½ to 2½; Libiola, 2½ to 1½; Mason and Barry, 3 to 3¼; Rio Tinto, 18½ to 18½; Tharsis, 5½ to 5½.

GLASGOW, WEDNESDAY.—Market firmer, with small business. Scotch done at 46s. 5d. and 46s. 5½d. cash, also at 46s. 7d. one month; closing with buyers at 46s. 5d. cash, sellers ask 46s. 5½d. Cleveland done at 38s. 1d. cash; closing with buyers at 38s. 1d. cash, sellers ask 38s. 2d. Cumberland hematite done at 48s. 2d. and 48s. 3d. cash; closing with buyers at 48s. 3d. cash, sellers ask 48s. 3½d. Middlesbrough hematite done at 45s. 9d. cash, also at 45s. 11d. one month; closing with buyers at 45s. 9d. cash, sellers ask 45s. 10d.

### LIVERPOOL OIL AND COLOUR MARKET.

WEDNESDAY.

OILS.—Palm oil is decidedly weak, and sales are being made at a reduction to £18. 17s. 6d. transit, and £18. 15s. forward. Olive is steady and firm, there being a decent business doing at £28. to £35. per tun. Linseed is unaltered, Liverpool makes still being quoted 19s. 9d. to 21s. per cwt., according to quality. Cottonseed is steady, and keeps much the same in price, with Liverpool refined at 17s. to 17s. 6d. per cwt., in export barrels. Castor oil is rather quiet at 2½ to 2½d. for good seconds Calcutta, and first pressure French 2½d. to 2½d. per lb. There is no change in the price of tallow, and the market is dull. Resin is only offered in small quantities, so that while the demand is steady prices are fully maintained. Spirits of turpentine are considerably dearer owing to scarcity, and now stand at 21s. 9d. per cwt. for immediate delivery. Petroleum is firm, with American at 6½d. to 7½d., and Russian refined 5½d. per gallon.

COLOURS are steady, without alteration in prices. Ochres: Oxfordshire, common, £10., medium, £12., best, £15. Derbyshire, common, 40s.; medium, 50s., best, 60s.; Welsh, best, 90s., seconds, 50s., and common, 18s.; Irish, Devonshire, 40s. to 45s.; French, J.C., 60s. to 65s.; M.C., 65s. to 67s. 6d. Umber: Turkish quiet; Devonshire, 50s. to 55s. White lead, £16. Red lead unchanged. Venetian red, £6. to £10. Cobalt: Prepared oxide, 9s. 9d.; black, 9s.; blue, 6s. Zaffres: No. 1, 3s. 6d.; No. 2, 2s. 6d. Oxide of iron: Common, £7.; medium, £10.; finest, £20. Zinc oxide, £22. 10s. to £25.

### TYNE CHEMICAL REPORT.

TUESDAY.

There is no change to report in the market for chemicals, and there is very little improvement in the demand. Soda crystals, £2. 2s. 6d. per ton, gross weight, locally. Caustic, 76/77%, £9. 5s. per ton; 70%, £7. 10s. to £7. 15s. per ton. Sulphur, £3. 17s. 6d. per ton.

Bleaching powder, 50s., £7. 5s. per ton, nett; nards, £7. 10s. per ton, nett; caustic soda, 76/77%, £9. 5s. per ton, nett; do., 70%, £7. 15s. per ton, nett; recovered sulphur, 2 cwt. bags, £3. 17s. 6d. per ton, nett; soda ash, 48%, £4. per ton, nett; do., 50%, £4. 3s. 4d. per ton, nett; do., 52%, £4. 6s. 8d. per ton, nett; alkali, 36%, £2. 15s. per ton, nett; white alkali, 48%, £4. 10s. per ton, nett; do., 50%, £4. 15s. per ton, nett; do., 52%, £5. per ton, nett; hyposulphite of soda, 5-7 cwt. casks, £6. 5s. per ton, nett; do., 1 cwt. kegs, £7. per ton, nett; silicate of soda, 75° Tw., £2. 12s. 6d. per ton, nett; do., 100° Tw., £3. per ton, nett; do., 140° Tw., £3. 7s. 6d. per ton, nett; soda crystals, casks, £2. 2s. 6d. per ton, gross weight; do., 2 cwt. bags, £2. 2s. 6d. per ton, nett weight; chlorate of potash, 5d. per lb., less 6%; pearl hardening, £3. per ton, nett; pure white sulphate of alumina, £3. 17s. 6d. per ton, nett; blanc fixe, £7. 5s. per ton, nett; chloride of barium, refined crystals, £6. 15s., per ton, nett; do., 90/95%, crude calcined, £6. per ton, nett; sulphide of barium, crystals, £4. 15s. per ton, nett; carbonate of alumina, £30. per ton, nett; aluminate of soda, £30. per ton, nett.

SALT.—South Durham steady, at 9s. per ton, f.o.b. Tees.

**COALS.**—The coal trade has little to report. The shipping season now commencing is bringing in more orders. Prices generally continue very low:—Best Northumbrian steam, 7s. 6d. to 8s. 3d. per ton; second qualities, 6s. 6d. to 7s. 3d. per ton; small steam, 3s. 9d. to 4s. per ton; bunker coals, unselected, 6s. 3d. to 6s. 9d. per ton; gas coals, 7s. to 7s. 3d. per ton; household coals, 10s. to 10s. 6d.; coke, very firm, 14s. to 15s. per ton.

## HULL PAINT, OIL, AND COLOUR REPORT.

TUESDAY.

**OILS.**—The market price of oils since the holidays has shown some little improvement, both cotton and linseed oils having advanced during the year, compared with the same time a year ago, have been:—Linseed, 162,215 quarters, against 135,449 quarters; rapeseed, 14,119 quarters, against 25,822 quarters; cottonseed, 66,545 tons, against 72,120 tons; olive oil, 7,424 casks, against 3,337 casks; rape oil, 1,539 casks, against 3,802 casks; oil cakes, 5,710 tons, against 5,131 tons; tallow, 11,220 cwt., against 4,085 cwt.; bones, 3,404 tons, against 1,871 tons; turpentine, 6,220 barrels, against 3,148 barrels. Linseed oil has advanced about 7s. 6d. per ton, closing steady at 18s. naked, spot; month, 18s. to 18s. 1½d.; May-August, 18s. 6d.; and September-December, 18s. 7½d. Boiled and refined from £1. to £2. per ton extra. Export for the fortnight, 3,260 cwt. Refined cotton oil about 7s. 6d. per ton dearer on the spot, the closing quotation being about 15s. 1½d. naked; May-August, 15s. 7½d. to 15s. 9d.; casks £1. and barrels £1. 10s. per ton extra. Export of refined oil for the fortnight, 12,920 cwt. Turpentine, £1. 8s. 9d. per cwt. Cod oil, scarce, from £17. to £20. per ton. Olive oil quiet, and values have a tendency to fall still further. Castor oil, 2½d. per lb. for first pressure. Boiled siccative oil, £13. per ton. American cottonseed oil soap: 70% fatty matter is offered at £11. 5s. per ton, in barrels. Locomotive grease, £12. per ton.

**CAKES.**—Linseed cakes quiet, but steady: 95% pure, £6. to £6. 2s. 6d. per ton; Russians, £5. 17s. 6d.; Americans, £5. 5s. Oil cakes, £5. to £5. 2s. 6d. Cotton cakes are firm, but fresh orders scarce: Best makes, £3. 15s.; seconds, £3. 12s. 6d. Rape cakes unchanged.

**PAINTS.**—Orders are plentiful and makers busy. Prices are:—White and red leads unchanged, also oxide of zinc; dry mineral colours range from £3. 10s. to £8. per ton; venetian red, oxide of iron, yellow ochre, blue, black, etc., paints from £11. per ton; paint remover, £1. 5s. to £1. 10s. per cwt.

## New Companies.

**Bird and Son, Limited.**—CAPITAL, £80,000. in £10. shares. This company has been formed to acquire the business of Messrs. Bird and Son, of Glamorgan Works, East Moors, and Imperial Wharf, Cardiff, and to trade as oil importers and refiners, tar, resin, and ammonia distillers. The subscribers to the memorandum of association are:—R. Bird, Ellerslie, Cardiff, oil importer; Mrs. R. Bird, Ellerslie, Cardiff; C. H. Bird, 38, Newport-road, Cardiff, oil importer; Mrs. C. H. Bird, 38, Newport-road, Cardiff; F. G. Bird, 6, Fitzalan-place, Cardiff, oil importer; W. R. Bird, 46, The Parade, Cardiff, engineer; A. G. Bird, Ellerslie, Cardiff, engineer.

**"H. B." Linseed Oil Co., Limited.**—The following are the subscribers to the memorandum of association of this company, further particulars of which were given in last issue:—J. C. Howley, 30, Greenside-road, Shepherd's Bush, secretary; H. W. Smith, 1, Prospect-place, Long Ditton, chemist; R. C. Heath, Myton Grange, near Woolwich, solicitor; G. Miles, 34, Leppoc-road, Clapham, engineer; W. E. B. Blenkinsopp, Garden Wharf, Battersea, chemist; R. C. May, 1, Moorgate-place, E.C., solicitor; H. T. Smith, 22, Gre Winchester-street, E.C., accountant.

**New Cement Co., Limited.**—CAPITAL £16,500., in shares of £1 each. This company has been formed to manufacture, sell, and deal in cement, lime, plaster of Paris, whiting, &c. The subscribers to the memorandum of association are:—A. J. White, 6, Adam-street, Adelphi, gentleman; A. Hoare, 36, Palace Gardens Terrace, V., gentleman; A. Kennedy, 1, Clement's Inn, W.C., solicitor; W. Slark, 6, Searle-street, Lincoln's Inn, solicitor; J. Lee, 78, Warwick Gardens, Kensington, C.A.; W. MacBurnett, 7, Arundell-street, Piccadilly, solicitor; J. W. Pickering, 96, Guildford-street, W.C., clerk.

## ADVERTISEMENTS.

**CTICAL CHEMIST or FOREMAN Wanted,**  
knowledge of Cyanide Manufacture. Liberal remuneration will be given  
ably competent man.—Address, "Chemist," Wm. Porteous and Company,

**BLEACHERS AND CHEMICAL MANU-**  
**CTURERS.**—Advertiser wishes Situation in Works or Laboratory.  
rs at Manchester Technical School. Good references. Address, "N,"  
*Trade Journal.*

## Notices.

Communications for the *Chemical Trade Journal* should be  
ed, and Cheques and Post Office Orders made payable to—  
**DAVIS BROS., 32, Blackfriars Street, MANCHESTER.**

Our Registered Telegraphic Address is—  
"Expert. Manchester."

NATIONAL TELEPHONE 3060.

Terms of Subscription, commencing at any date, to the  
*Chemical Trade Journal*,—payable in advance,—including postage  
part of the world, are as follows:—

|                                |          |

Advertisements intended or insertion in the current week's issue  
reach the office by **Thursday morning** at the latest.

## CURRENT TOPICS.

### THE INCANDESCENT LITIGATION.

THE string of actions that have been in progress during the  
past few weeks in connection with the Welsbach patents  
for the manufacture of incandescent mantles have been of a  
most interesting nature, and the most important of chemical  
cases since the trying of the cyanide patents.

In the present actions the substantial question to be settled  
was essentially a chemical one, and called for a careful dis-  
crimination of scientific evidence more than for the resolution  
of any knotty legal point.

The decisions in the cases of the De Mare and the Sunlight  
Companies are given elsewhere, and though apparently opposed  
to each other, are both more or less in favour of the Welsbach  
patents. The ruling on the defence set up that the plume of  
the De Mare patent was altogether a different thing from the  
Welsbach fabric or mantle is most conclusive, and prac-  
tically makes it impossible to produce an incandescent light  
as good as that obtained by the Welsbach process without  
infringing the patent.

As is general in such actions the defendants tried first to  
prove that the Welsbach patent was invalid, and then to  
show that there had been no infringement. On the first  
count the Court has emphatically upheld the validity of the  
pioneer patent, so that the matter becomes restricted to the  
question of infringement. In the De Mare case this point  
was settled in favour of the plaintiffs, the decision being deci-  
sive in every particular. In the Sunlight case judgment was  
in favour of the defendants, the Court holding that there had  
been no infringement.

The reasoning by which this conclusion was arrived at goes  
a long way, however, towards showing that it is very difficult,  
and at present practically impossible, to obtain the best  
results without invalidating your patent. His Lordship stated  
that he did not think much of the Sunlight (Dellwick's) patent.  
The opinion of a judge carries little weight on matters other  
than legal, it is true, but the whole tone of the judgment  
points to the above deduction.

Taking all things into consideration it does not appear  
probable that the question of patent rights will be finally and  
definitely settled for a considerable time to come—two or  
three years perhaps—but the benefits that will attend the  
De Mare decision will not be so long delayed. The Welsbach  
patent is now undeniably substantiated, and its most formid-  
able rivals will be restrained by injunction. At the same  
time, while benefiting thereby, there will also be a healthy  
stimulus in the existence of the Sunlight patent, thus avoiding  
the constitution of an entire monopoly which is unwholesome.

Apart from the main issue, there is, however, a very strik-  
ing lesson to be learned from these actions regarding expert  
evidence. We have long contended that the correct rôle of  
the scientific expert is that of counsellor and referee, and h<sup>1</sup>

right position that of Court delegate, as opposed to the present position of a witness paid to give evidence, either for or against. The present arrangement makes it practically impossible to obtain the best and most impartial expert opinions except in those cases where the stake is a large one and the litigants are wealthy. Now that the pressure of cases has made it necessary to consider the advisability of making an addition to the judicial Bench, the element of time in the hearing of cases becomes as important to the legal fraternity as to the unfortunate litigants. There can be little room for doubt that if a change in the method of taking expert evidence was made, a great saving in time would result, apart from the fact that the prolonged cross-examination of experts by men who have a distinctly legal, rather than a chemical bias, is by no means always conducive to the elucidation of "the truth, the whole truth, and nothing but the truth." The chief difficulty our worthy judges apparently have to contend with in these cases is that of extracting the truths that bear on the case from the confusing mass of irrelevant statements with which they are surrounded. Would it not be far better for their lordships to be able to take advice on such points first hand? By the present system the skein is skilfully tangled during a hearing of several days duration, and then their lordships "reserve judgment" so that they may have time to disentangle it again.

#### FACTORY INSPECTION AND INSPECTORS.

The comparatively recent appointment of lady factory inspectors was generally looked upon as a step calculated to benefit those inspected and the employes, but the case that came before the Burnley Police Court last week, will not create a very favourable impression of these lady inspectors in the mind of the public.

Miss Anderson, it appears, has been appointed ten months, and this was her first prosecution. Her complaint was that the sanitary accommodation at a certain mill was inadequate, and in spite of notice no remedial measures were being adopted. Her statement was supported by the sanitary inspector, and we shall not presume to adjudicate in this matter, although the testimony of Dr. Harwood was directly opposed to that of the sanitary inspector and Miss Anderson. The point with which we are concerned is not the actual rights or wrongs of the case, but the anomalous position in which the lady inspector found herself when cross-examined. Mr. Roberts, for the defendants, stated that he was going to call experts, who held sanitary diplomas, and asked Miss Anderson if she had a diploma of sanitary science. Her answer was no, and she practically gave a negative answer to the query whether she had any sanitary diploma. When asked what means she used to ascertain that there was any effluvia, she merely stated that she visited the rooms. Since 1878 there have been plenty of inspectors in Burnley, but it was only after the appointment of this lady that exception was taken to the effluvia complained of. As several witnesses were called who denied the existence of any effluvia, and one of these witnesses held the sanitary science diploma of the University of Cambridge, the position of the Government representative was somewhat embarrassing.

We are fully alive to the fact that the mere acquisition of a sanitary science diploma counts for little against practical experience, but Miss Anderson unfortunately has only had a few months in which to acquire anything like an extensive practical knowledge. We have no doubt that Miss Anderson's appointment, in particular, was made on a satisfactory foundation, and that her qualifications were good, but we

think that for her own sake she must now wish that she had been armed for her task with the same weapons with which she is now being attacked. In a sense they are not very formidable ones, but in the present case they were sufficient to give the Philistines the advantage.

Quite independently of Miss Anderson's qualifications, it would appear from the foregoing that lady inspectors should in future hold some sanitary diploma. Whatever their qualifications may be, and however manifest their peculiar fitness for their task, they will occasionally have to contend in public with opposition from those they have to inspect. In so doing they will be confronted with those who can claim a right to speak on matters of sanitary science, and if their inspection is to count for anything the inspectors themselves must be in a position to establish an equal right to speak authoritatively.

#### THE FOOD ADULTERATION INQUIRY.

There have been a good many food adulteration inquiries, but the last one that has been made promises to do more than all the rest put together. The Select Committee are now busy considering their report, which will in all probability be rather startling. The chief good that has resulted has been the recognition of the fact that the present penalties are altogether useless, and it is encouraging to learn that the report will, it is anticipated, propose imprisonment without the option of a fine as the penalty for a second offence. This is not all, however, for the convicted party will have to publish his conviction in a conspicuous notice on his own premises. This additional condition may be thought superfluous, but, after all, why should it not be so when very much the same sort of thing is done with those thoughtless people who will persist in entering trains whilst in motion, or travelling without a ticket? There is frequently no intention to defraud, which is more than can be said about the majority of margarine prosecutions. If this change alone can be effected, there will be a great improvement in the quality of "butter."

The other projected recommendations refer to the better enforcement of the Food and Drugs Act, the testing of foreign butter as it comes into this country, and the appointment of a board of competent chemists to deal with doubtful cases. It is also probable that certain suggestions will be made concerning the colouring of margarine and butter.

The report, therefore, promises to be a satisfactory and helpful one. So far so good—very good indeed. The next thing is to give effect to the recommendations. All we can do is to hope for the best, and to urge upon the members of the committee the need for sustaining their vigilance, so that their labours may not be bilked in the same way as the work of the Petroleum Committee of 1868 was frustrated by the subsequent intervention of trade influences.

ONE MODE OF DEALING WITH AN INDUSTRIAL CRISIS.—The British Consul-General at Warsaw, in a recent report on the trade of his district, states that the sugar industry of the kingdom has again undergone a crisis similar to that of 1886-7, from which it was temporarily rescued by the Kiew syndicate. All arrangements for limiting the production and exporting the surplus seem to have ceased to be effective, and accordingly the Government took the matter in hand. At the end of last year a decree was issued providing that for three seasons—1895-8—the Minister of Finance is to fix the amount to be sold for home consumption, the stock to be kept in reserve, and the maximum price for the home market. The surplus to be manufactured beyond the amount fixed for home consumption is also to be settled by the Minister of Finance for each factory in accordance with its size, and when this surplus reaches 19,340 cwt., it is to be charged with an additional excise of nearly 10s. per cwt. Finally, the whole amount of the original and additional excise duty is to be returned to the factory on as much of the surplus as is exported to foreign countries.

## The Patent List.

This list is compiled from Official sources in the Manchester Laboratory, under the immediate supervision of E. Davis and Alfred R. Davis, who report professionally on the value of Chemical Patents.

### NOTIFICATIONS FOR ENGLISH LETTERS PATENT.

Consuming Furnaces. T. Brook. 7,332. April 7.  
 for Extracting Oils, etc., from Seeds. W. R. Harrison and E. Mason. 7,379. April 7.

 and Disinfecting Drains. C. T. Kingzett. 7,721. April 11.

### ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

Abstracts are specially prepared for the Chemical Trade Journal. Rights of publication are reserved. This is the earliest abstracts of Chemical and allied patents accessible to the

or Improved Process for the Treatment and Refining of edible Oils During or Subsequent to their Expression from Beans, Seeds, and the like. G. Mitchell, 47, Victoria-street, London, S.W. Eng. Pat. 9,157. May 8, 1895.

oils, notably castor oil, have a very unpleasant odour and rough extracted from seeds which have a pleasant flavour. tributed (and apparently correctly) to the combined action of and moisture, which causes the oil to ferment. With a view of getting this oil by this invention treated in a vacuum.

is conducted in the following fashion:—The oil from the which is generally open to the air but can be made so that the pressed into a vacuum chamber, is drawn by reduced pressure filter into a series of partially-exhausted vessels in which the essent is removed by the vacuum. The refined oil is then sucked into the bottling apparatus, from whence it is charged es from which the air has been exhausted, and is ready to be

The vessels in which the natural moisture is removed are l to the exhaustor by an independent pipe so disposed that the when once liberated cannot drop back into the oil. A special igned to facilitate the execution of this process is described in o. 16,259/92, while the bottling apparatus is of the same type ferred to in the application for Letters Patent, No. 9,155/95.

nents in the Fixation of Nitrogen and the Production of des. T. Twynham, Elmhurst, Egham Hill, Egham. Eng. Pat. 9,332. 1895.

ent of nitrogen, passed over carbon and an alkaline carbonate, temperature, forms an alkaline cyanide. The difficulty, how- been to obtain sufficient oxygen-free nitrogen suitably heated, pe with the extraordinarily heavy wear and tear on the plant, e external heating. These difficulties are met in the following —The nitrogen is obtained from the waste gases escaping from er converter. The gases after the carbon period and up to efore the drop of the flame can be used. In the preparation of d, however, the gases can be used until about the middle of the w. Such gases are passed through a refractory basic-lined ked with coke moistened with carbonate of soda or potash. neous heat is used, as the coke soon becomes heated by the hich are passed during several successive "blows" until cyanide is formed. The cyanide can be removed with water, nia can be formed at once by aid of the action of steam and air, case the alkaline base largely remains in the stack ready for In any case, however, it is advisable to place a condensing ent at the end of the shaft to retain any volatile cyanide at otherwise escape

nents in Treating Chlorides for the Production of Chlorine and es or Alkaline Earths, and the Recovery of Bye-products. in, Ardeer Cottage, Stevenson, Ayrshire, and W. Donald, Canal-street, Ayrshire. Eng. Pat. 10,713. May 30, 1895.

parts of salt and manganic oxide are treated with enough d of 68°Tw. to decompose the salt. Chlorine with a small proportion of moisture is given off, leaving a mixture of nitrates and manganese, water, and free nitric acid. This mixture is ed and roasted, the nitrates being converted into nitrogen and finally into nitric acid by subsequent treatment. The

resulting compound of soda and manganese is dissolved, while hot, in water, and oxidized with air. When the reaction is complete, the caustic soda solution is removed, and prepared for market in the usual way, while the peroxidized manganese is used over again. Other suitable chlorides and oxides can be used, and in case the caustic alkali may not be as soluble as that of soda, the roasted residue can be oxidized by hot air. The chlorine is generated in an ordinary stone still, and the evaporation and roasting can be conducted in a furnace of the muffle salt cake type.

Improvements in Treating Nitrates for the Production of Nitric Acid, and the Recovery of Bye-products. R. Main, Ardeer Cottage, Stevenson, Ayrshire, and W. Donald, Canal-street, Saltcoats, Ayrshire. Eng. Pat. 73,819. Dec. 12, 1895.

A mixture of nitrate of soda and manganic oxide, in proportions depending upon the purity of the nitre, is roasted in a muffle furnace. The evolved oxides of nitrogen mixed with air are passed into a trickling tower and converted into nitric acid. To obtain the latter of high density, the acid from the oxidizer is mixed with enough vitriol to combine with the water present, and the whole distilled at a regulated heat. The nitric acid comes over first and is collected. Next the water can be driven off, leaving the vitriol fit to be used afresh. The furnace product, consisting of soda and manganous oxide, is treated with steam and water to extract the soda, and blown with air to reoxidize the manganese. The hydrate of soda is worked up in any suitable fashion.

An Improved Process for Obtaining Acetic Acid from Pyroligneous Salts. W. P. Thompson, 6, Lord-street, Liverpool, etc. (communicated by Dr. Carl von der Linde, 192, Uerdingerstrasse, Crefeld, Germany). Eng. Pat. 3,987. February 21, 1896.

The production of acetic acid by decomposing pyrolignite of lime with acids and distilling does not yield pure acetic acid, especially when vitriol is used in the decomposition of the pyrolignite of lime. By decomposing with acids and then distilling *in vacuo* a pure product results. The higher the vacuum the better the acid, as acetic acid boiling at 119°C under ordinary pressure boils at 60°C. *in vacuo*. By thus lowering the temperature of distillation the decomposition of the tar spirit and oils mixed with the pyrolignite are prevented, and the distillate obtained free from all foreign admixtures

Improvements in the Manufacture or Production of Cyanogen Compounds. A. von Rad and J. Rosenfels, both of Ptersee-Augsburg, Bavaria. Eng. Pat. 1,022. January 15, 1896.

This invention is practically another solution of the difficulties set forth in patent 9,332/95 when preparing cyanides from nitrogen gas, carbon, and an alkaline carbonate.

In this instance suitable carbides are used. Thus by passing nitrogen over barium or calcium carbide, cyanide is formed at a red heat instead of a white heat as by the old method. A more economical method is to treat the calcium carbide with carbonate of potash. It is probable that the following reaction then ensues:—

the  $\text{CO}_2$  being reduced to CO by excess of carbide. The nitrogen, it is assumed, is therefore fixed in accordance with the equation

The direct conversion of ammonia into cyanide can be similarly accomplished:—

The advantages claimed for this carbide method are that only a red heat is necessary. When using ammonia almost the theoretical yield is obtained. In making ferro-cyanides pure materials can be used, thus keeping out disturbing elements, and soda can be substituted for potash.

TYLDESLEY SEWAGE SCHEME.—The new system adopted by this District Council, and executed at a cost of about £3,250, will be inaugurated to-day (25th instant). The works have been designed to treat 300,000 gallons of sewage daily. The process is that of the Magnetite Sewage and Water Purification Company, of Manchester. Under this system the sewage is carried on to filter-beds composed of layers of "magnetite," a kind of ironstone, with a top layer of sand, a filtering medium which has been patented by this company. These filter-beds are self-regulating, and the top layer of sand is cleansed by the simple process of reversing the flow of one filter and allowing it to force itself upwards through the next filter. The floating matter, lifted from the top of the sand, then runs into a well, and is thence pumped into "detritus tanks." After leaving these tanks, the precipitant is added to the sewage by means of a Keirby mixer, worked by a water-wheel turned by the flow of the sewage. The cleansed sewage then passes through a "mixing race" to the inlet channels, and to the precipitation tanks, which are of quite novel design. The tanks have been constructed with concrete bottoms, with walls faced with salt-glazed brick. There are eight filter-beds, each 35ft. by 16ft. The precipitant used is "elite," principally alumina, iron, and oxide of magnesium.

## Official Memoranda,

(From the Board of Trade Journal.)

### CUSTOMS TARIFF OF GUATEMALA.

The following is an abstract of the recent changes in the customs duties of Guatemala:—

|                                                                                            | per kilo. | dols. cents |

| Mineral Oil                      | Zinc, ingots, and sheets, either plain or perforated |

### TARIFF DECISIONS.

#### THORIUM SALTS.

The French Customs authorities have made the following announcement—"Thorium salts, especially nitrate, solutions of which are employed in the preparation of incandescent gas-burners, belong to the class 'Chemical Products not denominated, other than of an alcoholic basis,' and pay a duty of 5 per cent. *ad valorem*. The estimation of the value of these products having given rise to many disputes, the Departments of Trade and Finance have decided to convert the duty of 5 per cent. into an equivalent specific rate, and considering that the value of thorium salts, once 2,000 frs. per kilogram, is now only about 400 frs. on account of recent discoveries of extensive deposits of thorium ore, it has been decided to substitute for the duty of 5 per cent. *ad valorem*, a specific rate of 20 frs. per kilogram.

#### UNITED STATES DECISIONS

*Scrap mica*, consisting of pieces of mica of irregular shape, varying in sizes from 2 or 3 inches square to areas still smaller, is dutiable at 20 per cent. *ad valorem* as mica under paragraph 1673½.

*Calcined magnesite*, or furnace cement, is dutiable at 10 per cent. *ad valorem* under paragraph 79 as "cement" other than Roman, Portland, or hydraulic cement.

*Asbestos fibre* is entitled to free entry as asbestos in an unmanufactured state under paragraph 388.

*Crocus* is to pay duty as a colour at 25 per cent. under paragraph 61, Act of October, 1890.

### THE BOMBAY SALT TRADE.

According to the report on the administration of the Bombay Salt and Continental Customs Department for the past year, the 1894-95 salt season was generally favourable for manufacture throughout the Presidency; the number of works was increased, and the works at Sanikatta were reopened with improved arrangements for storage. At the Runn works the quantity of salt manufactured and brought to account was, with the exception of one year, the largest on record by our lakhs of maunds. The most marked improvement was, however, in the Konkan works, where the previous year's figures were improved

on by 35 per cent. At Kharaghoda, it is shown, experiments were continued for the purpose of discovering fresh sources of supply, and resulted in a substantial addition to the known brine-yielding area while the whole of the ground was surveyed and demarcated with view to the elaboration of a scheme for the systematic development of the works. The Imperial revenue under salt increased by close upon 18 lakhs in the year, a fact which is attributed to the growth of the issues from all works in the Bombay Presidency, to larger imports from Goa, and also to some extent to an increase in the duty recovered under the credit bond system on salt issued in the previous year. Meanwhile charges were the same, and the expense of working unaltered.

### UTILISATION OF WATER POWER IN NORWAY.

The *Engineering and Mining Journal* states that the estate of Hafslund, near the great waterfall known as the Sarpsfos, between Christiania and Göteborg, has been acquired by a syndicate, chief consisting of German and American capitalists, for the sum of 800,000 kroner. The purchasers intend to form a large company, with capital of 3,000,000 to 5,000,000 kroner, in order to utilise the water-power of the falls for electrical force, and establishing aluminium works on the same principle as those now being constructed at the falls of Foyers, in Scotland. The Sarpsfos is one of the finest falls south-eastern Norway, being 74 ft. in height and 116 ft. in width. The water power is already utilised, however, by numerous sawmills, cellulose factories, and the railway crosses the fall, so that the proposed new works will probably not interfere to any great extent with the artistic aspect of the place.

### INDIA-RUBBER FROM THE SOUDAN.

A despatch has been received from Colonel A. H. Maclean, British Vice-Consul at Dakar, Senegal, enclosing a table showing the values and description of certain balls of india-rubber submitted to Monsieur Sampaïn, President of the Chamber of Commerce of St. Louis, for examination.

These specimens of india-rubber were received from the Soudan by the Governor-General of "Soudan-Senegal" on his return from the Soudan.

In order to encourage the cultivation of plants producing india-rubber this substance is now received in payment of taxes in the districts mentioned in the report.

The table can be seen on application at the Commercial Department, Board of Trade, 7, Whitehall Gardens, S.W., between the hours of 11 and 5.

## Legal Intelligence.

### HIGH COURT OF JUSTICE.

#### QUEEN'S BENCH DIVISION.

(Before Mr. Justice Wills, without a Jury.)

THE INCANDESCENT GAS LIGHT COMPANY (LIMITED) v. DE MARE INCANDESCENT GAS LIGHT SYSTEM (LIMITED).

Judgment was given in this case last week. The plaintiffs complained of threatened infringements by the defendants of letters patent granted to Carl Auer von Welsbach for the manufacture of an illuminant appliance for gas and other burners, being No. 15,286 of 1885.

Mr. Moulton, Q.C., Mr. T. Terrell, Q.C., Mr. A. J. Walter, and Mr. J. H. Gray appeared for the plaintiffs; Mr. Bousfield, Q.C., Mr. Wallace, Q.C., and Mr. Jenkins for the defendants.

Mr. Justice Wills, in the course of an elaborate judgment, said it had long been known that certain substances, notably lime, magnesia, and zirconia, when subjected to the heat of a flame of mixed coal gas and air will produce a brilliant incandescence. The common oxyhydrogen lime light is well known. Zirconia had been used, on a very small scale, in the same way, and the illuminant properties of magnesia were also well known. Many attempts had been made to utilise their properties by introducing such substances into the flames of gas, or of gas and air mixed, but they had all for one reason or another come to nothing. I am not going, said his lordship, to enter at present into questions of anticipation; but it is quite safe to say that for all practical purposes Welsbach discovered a practical and simple method of arranging oxides to be rendered incandescent in a shape which made it possible to use them in burners, and also discovered that a class of substances which for convenience and brevity are generally spoken of by chemists and throughout the hearing of this case have been called "rare earths," would afford at once the necessary illumination and the necessary coherence. The process adopted by Welsbach begins by taking a fabric made of cotton of suitable pattern and proceeds to impregnate it with salts of the blends of oxides of lanthanum and zirconium, or of those with oxide of yttrium, and then ammoniates it. The result of

ing is to get the salts into every minutest portion of the fibres, so that when finally the cotton fabric itself is eliminated there may be left a solid substance occupying almost the very space now filled by the impregnated fabric. The result of this is to convert the salts into hydrated oxides, filling, as did the innermost recesses of every portion of the fabric. The hood is not yet fit for permanent use in the burner. The last operation is to place the hood in the burner and set on fire by lighting.

This process drives off all the water of the hydrated oxides and leaves them in their final condition of anhydrous oxides, in which they perform the business purpose of giving illumination of incandescence. The claim made by the patentee is the combination of the essential elements in the process described. If the process is as the defendants held out they were going to use is substantially the same with this process, they are liable in this action. Several objections have been taken to the patent. First it is said that the invention was not the proper subject of a patent, with reference to what was new, and was not novel. In my opinion these objections are wholly ill-founded. The invention, with improvements which had followed in its train, has undoubtedly created a great new industry not only in the caps or hoods which are the subjects of it, but in the extraction of the oxides and salts of the rare metals. The globe has been supplied for new sources of supply. The invention has for the first time brought within the range of practical manufacture the production of a brilliant light by incandescence within an ordinary gas flame. It appears to me to be no ground whatever for the attack made on the patent on the score of want of novelty. The field upon which it has entered was untrodden and marked only by the absolute failure of every attempt to penetrate it. It is next set up that the invention is not useful—a singularly hopeless contention. An attack was made on the patent in respect of the direction in the specification to use the mantle before burning it; a direction which, it was said, under some conditions not excluded by the specification, would be the mantle, which will in such cases fall to pieces. I am satisfied by Mr. Ballantyne's evidence that careful washing is the ordinary method, and that he has found no difficulty with a washing even less than would be ordinarily applied, and that the defendants' objections are due to the fact that they did not reasonably cleanse the mantle. This ground of objection to the validity of the patent fails. The next ground of attack is that the proportions of the ingredients are wrong, and no directions are given as to the strength of solution, and that a competent workman would need other directions. The proportions actually given are right and work well. I am satisfied with the evidence of the plaintiffs' witnesses that the want of a direction as to the strength of the solution would have presented to a man competent to do this class of work a real difficulty. Excellent hoods were made by persons at the defendants' acquainted with anything but the Welsbach specification. As to the question of infringement it is clear that the defendants intend to make and (or) sell in this country plumes for incandescent lamps, which consist of a number of threads tied on to a platinum wire and so as to form a sort of fringe, all the threads of which are very closely together while they are strung on to the wire, but to separate as they leave it, so that the apparatus looks like a fan's small handbrush, the cross sections of which would take the shape of a fan. This plume is then to be dipped into a solution of preferably of one part of sulphate of magnesium, two parts of erbium, and two parts of sulphate of zirconium (all highly pure) in 25 parts of water. The plume may be dipped into a varnish for the sake of strength, and is then to be suspended in the flame of a gas-burner to produce incandescence. More than 100,000 specimens delivered by the defendants as specimens of what they claim to make were found to consist of oxide of zirconium 84 per cent., of yttrium sub-group 9 per cent., and oxide of magnesium 16 per cent. Welsbach's limits of proportion are very large. Enough to satisfy me that, unless the omission of ammoniation, the omission of lanthana, and the variation in the form of the illuminant are prevented, the defendants were about to infringe, and ought to be restrained. The plume is, in my opinion, a fabric. Welsbach's invention gave undoubtedly a perfectly new result, and in every respect to be described as a "pioneer" invention. His specification describes the whole process by which he arrived at that result. Out of it the defendants take the impregnation of the fabric by blends of salts of the rare earths, and the reduction of these to anhydrous oxides. I am satisfied by the evidence that it is this mode of getting the specified oxides into the shape of the fabric out of which has been made that has rendered the process of any use, and that any variation of prescription, extending even to the omission of the ammoniation, is of very little consequence in comparison. The only result of the omission of the ammoniation is that you get the same result by as you get by two if you ammoniate the fabric. This is strictly a chemical equivalent perfectly well known at the date of the invention and can have no bearing upon the question of infringement.

The plume is, no doubt, a form of appliance suited to a batswing burner, to which the Welsbach cap or hood would be inapplicable. Welsbach, however, points out that the form and construction of the fabric may be varied to suit different burners. The substance of Welsbach's invention, as described in his specification, is, in my opinion, appropriated by what the defendants are proposing to do; and I, therefore, give judgment against all the defendants upon all the issues, with costs, and grant the injunction prayed for, and I certify, pursuant to section 31 of the Patents and Trade Marks Act, 1883, that upon the trial of this action the validity of the letters patent granted to Carl Auer Von Welsbach, No. 15,286, dated the 12th of December, 1885, came into question; and I further certify, pursuant to section 29 of the same Act, that at the trial of this action the plaintiffs proved the particulars of breaches delivered by them. The shorthand notes of the evidence, costly as they must be, have greatly abridged the length of the trial, and have been a saving of expense, and the notes and printed transcripts must be allowed.

Judgment accordingly, with liberty to apply upon certain questions as to the scale of costs, and as to whether solicitor and client's costs are to be allowed.

THE INCANDESCENT GAS LIGHT COMPANY (LIMITED) v. THE SUN-LIGHT INCANDESCENT GAS LAMP COMPANY (LIMITED) AND OTHERS.

In this case the plaintiffs complained of an infringement and threatened infringement of the patent of 1885 to which the De Mare case related.

Mr. Moulton, Q.C., Mr. Terrell, Q.C., Mr. A. J. Walter, and Mr. J. H. Gray appeared for the plaintiffs; Mr. Bousfield, Q.C., Mr. Wallace, Q.C., Mr. Jenkins, and Mr. Emery for the defendants.

Mr. Justice Wills, in giving judgment, said—The defendant company was formed to work a patent granted to one Dellwik. The defendants take the idea of the skeleton hood produced by the Welsbach process, but make it of about 50 to 60 per cent. of alumina, about 30 per cent. of zirconia, and then coat this with a thin coating of oxide of chromium. It seems to me that this is essentially different from what is claimed by the Welsbach specification. Welsbach might have claimed the hood made of any materials, but that would have entirely altered his patent and would have exposed it to a fresh set of dangers. He might have claimed the hood, of whatever material, applied for the purpose of illumination, but that would again have altered his patent and have made it void, for it would have been a patent for the use in the form of a hood of whatever substances would answer. But he did claim nothing of this kind. The use of the rare earths is beyond all doubt of the essence of his invention. He could not by any adaptation make a strong groundwork of alumina, or alumina and zirconia, and then spray it or saturate it with the salt of an illuminant oxide to be reduced to the oxide on putting it into the flame, which is what the defendants have done. It was a necessary consequence of the nature of Welsbach's process that his skeleton should be absolutely homogeneous throughout. I feel that the defendants are taking a very valuable process bodily from Welsbach without any remuneration; but that is the necessary fate of a patentee who confines himself to claiming the aggregate of a whole string of processes of which this is one. The fatal difficulty in this case is that the formation of a Welsbach skeleton by other means and of other substances than those pointed out in the specification is not claimed. No use is made by the defendants of any of the rare earths, and their choice of substances and their method of applying the illuminants appear to me to be as far asunder as the poles from that contemplated by Welsbach. I must therefore give judgment for the defendants upon the issue of infringement.

Judgment for defendants, with the liberty to apply upon certain questions as to costs.

THE COST OF CALCIUM CARBIDE.—Up to now the chief interest concerning calcium carbide as a source of acetylene has centred around the question of cost, as upon that practically everything depends. So far the figures and statements that have been put forward have not been over accurate, and have mostly revealed the fact that the authors have been guessing a good deal. Our enterprising American contemporary, *Progressive Age*, says:—"Recognising the importance to the world of artificial lighting, of full, accurate, and reliable information, we determined if possible to conduct at Spray (N.C.) a series of exhaustive tests which should show beyond refutation the cost of carbide of calcium." In carrying out their intention permission was obtained from the Electro Gas Company for a party of chemical and electrical experts to have sole charge of the Company's works for a week, during which to make a series of thorough and impartial tests, to determine accurately the cost of production. Professor Houston and Dr. Kennelly are representing the electrical interests, and Dr. Kinnicutt, of the Worcester Polytechnic Institute, the chemical aspect of the question. The results of the inquiry will be published in due course.

## Parliamentary Gossipings.

### GERMAN COMPETITION IN COAL.

In the House of Commons, on Monday,

Sir Howard Vincent asked the President of the Board of Trade if he was aware that arrangements were being made to bring considerable and increasing quantities of Westphalian coal to London, in flat-bottomed boats, loading far up the Rhine, at an inclusive land and water freight of about 6s. a ton, owing to the nominal rates charged by the German State Railway, for the development in England of German industry; and if he would cause this new source of practically subsidised foreign competition to be carefully watched, that the British coal-mining industry might take such steps as were possible to meet it.

Mr. Ritchie said he had no special information on the subject, but he would be happy to make inquiry through Her Majesty's Consul at Dusseldorf.

### THE PROTECTION OF INVENTORS.

In reply to Sir J. Leng,

Mr. Ritchie said the full address of every applicant for a patent was published for about seven months in the illustrated official journal. No means existed of ascertaining if any and how many inventors were precluded from opposing applications made by persons to whom they had communicated their ideas, but whom they could not trace in the address of a patent agent. There was no reason for apprehending there were many such cases, and he did not propose to alter the present procedure.

### THE METRIC SYSTEM.

Mr. Arnold-Forster asked the First Lord of the Treasury whether, in view of the fact that the metric system of weights and measures had recently been adopted by Turkey, Russia, and Japan, and was now in use in all the civilized countries of the world with the exception of the British Empire and the United States, and in view of the fact that metric measurements had already been adopted with respect to the ton and for all purposes of pharmaceutical dispensing in the United States, the Government would take immediate steps to give effect to the practically unanimous recommendation of the Committee on the Metric System, with the object of placing this country on a level with other civilized nations in the matter of weights and measures?

Mr. Balfour replied that the recital of the facts given in the question was, he believed, correct. It was not yet, however, within the range of practical politics, in his opinion, to impose by law on the inhabitants of this country so great a change as would be involved in giving effect to the recommendations of the committee.

Mr. Arnold-Forster: Is the right hon. gentleman aware that a Bill for this purpose has been introduced in the House of Representatives in the United States?

Mr. Balfour: I believe that is so. It is not passed into law yet.

## THE MINERAL OIL INQUIRY.

CONTINUING his evidence before the Select Committee of the House of Commons, last week, Mr. A. Spencer stated, in reply to the chairman, that the statistics of lamp accidents in London showed that, while in 1866 19 such accidents were reported, the number had gone on increasing until last year a total of 473 was reached. The deaths from this cause increased from 1 in 1874 to 23 in 1895. In all these cases fire ensued, and the brigade were called out to extinguish it. The figures just given did not give the total number of petroleum accidents, because it was well known that there were numerous small fires occurring daily to which the brigade were not called. He was informed by the representatives of the insurance companies that the number of these small fires outnumbered those to which the brigade were called, and that at least half of them were caused by petroleum lamp accidents. Assuming that there were 3,600 small fires in London last year, nearly 2,000 would have been caused by lamp accidents. In Germany the number of lamp accidents was less numerous than in this country, because, although cheap, dangerous lamps were largely made and exported thence, they were not much used in Germany. The London County Council were of opinion that the sale of dangerous lamps should be entirely prohibited. All the oils causing accidents were above 73deg. Fahrenheit flash-point, and in one case the flash-point was as high as 110deg. He suggested, therefore, that this should be raised to 120deg. In his opinion, safety could practically be secured either by burning oil of a sufficiently high flash-point, 120deg or more, or by burning the oils now in ordinary use in properly constructed safety lamps. The witness, by way of illustration, produced a number of lamps which he described as respectively dangerous and safe. The former were generally made of glass reservoirs, were sold retail at prices ranging from 1d. to 10½d. and 1s. 9d., and were in common use among the poor. Safe lamps, on the other hand, were generally constructed of metal reservoirs.

There were many lamps, with the exception of the burners, made exclusively of glass, some of them very expensive, which were in use in all classes of society and which under certain conditions were dangerous. There was no way of stopping the use of the large number of lamps already manufactured and on sale in actual use in private houses, but, as a practical method of preventing the sale of dangerous lamps, he suggested that the Secretary of State should have power from time to time to issue an order declaring that after a certain date it should be unlawful to make, expose, or offer for sale any lamp or other appliance intended to be used for the burning of mineral oil for purposes of illumination unless it was constructed in accordance with the prescribed specifications, and any person making or exposing for sale any lamp or other appliance not so constructed should be liable to a penalty not exceeding £5. That would make the Home Office the sole arbiter as to the classes of lamps which should be allowed to be in use throughout the country.

## SOCIETY OF CHEMICAL INDUSTRY.

### NOTTINGHAM SECTION.

THE usual monthly meeting of the local section of the above society was held on Wednesday evening, the 15th inst., at the Mechanics' Institution, Derby, when members in a greater number than the average attended to hear a paper from Mr. John White, F.R.C.S., the county analyst. Amongst those present were Miss Ashwell, Mr. Firth, and Mr. Wood (hon. sec.), from Nottingham; Mr. Lott and others from Burton-on-Trent; and amongst the visitors from Derby were Dr. Greaves and Mr. C. D. Hart, the town members being represented by the chairman (Mr. Carulla), and Messrs. Archbutt and C. Taylor, C.E. The subject of Mr. White's paper was "Filtration and Domestic Filters." During the course of the address it was made clear that we have entered into a new era as regards the question of obtaining a safe water supply for domestic purposes, and that the reliance with which a great number of filtering appliances are received by the public is thoroughly misplaced. Although the use of sponge has long ago been abandoned as most objectionable for house filters, there are still in use other filters that our recently acquired bacteriological knowledge condemns. Mr. White exhibited numerous forms of domestic filters, experimenting with some by passing through them a mixture of milk and water, a clear fluid quite free from any turbidity being obtained in the case of the Whitman filter, which consists of a specially prepared carbon dish. The Berkefeld and the Pasteur-Chamberland, which consist of hollow candles made of unglazed porcelain, through the pores of which the water has to pass when being filtered, are also capable of sustaining this severe test. A very interesting account was also given in the paper of the examination made by Messrs. Woodhead and Wood of 35 various forms of filters that were before the public, with a view to ascertaining their power to arrest the passage of disease-bearing germs. The porcelain candle filters, such as the Pasteur-Chamberland, now in compulsory use in all the public schools of France, were the only ones that came out satisfactorily from this test. A discussion followed, in which Dr. Greaves, Mr. Wood, Mr. Lott, Mr. Archbutt, and the Chairman took part. Mr. White, in his reply, said, in answer to a question from the Chairman, that he did not think we had reached the acme of filtration. Replying to Mr. Wood, who thought the milk test a most severe one, he could not say what the exact size of the milk globules were, although they were certainly smaller than bacteria. He acknowledged his indebtedness to Mr. Archbutt for calling his attention to the investigations of Drs. Woodhead and Wood, which were not sufficiently known amongst chemists, who were frequently called upon to give advice on the subject. On the motion of the Chairman, a hearty vote of thanks to the lecturer was carried by acclamation, and the proceedings terminated.

## RECENT CHEMICAL PROGRESS.

IN the course of a lecture on this subject given last week at the Royal Institution, Professor Dewar, F.R.S., commented on the great future opened out to synthetic chemistry by the employment of the temperature of the electric arc. Some of the most interesting results had been obtained from the electric furnace by the French chemist, M. Moissan, in the shape of carbides, stable bodies produced by the combination at high temperatures of carbon with various metals. Many of these carbides were decomposed by water, the hydrogen of the water combining with the carbon to form hydrocarbons. Thus with water some carbides, such as that of calcium, gave acetylene; others, like that of aluminium, gave marsh gas, while others again gave these and other gases, and, what was most wonderful, liquid petroleum. It was a curious fact that many years ago Professor Mendeleef speculated that the only reason for the immense localization

neum at Baku was that it was being generated there—he said by the action of water on carbides. His idea was rather then, but now it was his turn to smile. When acetylene was a dull, red heat, it was polymerized to benzene. Benzene was the basis of all the new modern colours, and thus by three direct steps were able to reach the nucleus of all the colours hitherto derived from coal-tar products. First there was the combination of coke in the electric furnace; second, the decomposition of the gas thus formed by water; and third, the transformation into acetylene by means of heat. Professor Dewar has been occupied by briefly discussing some of the properties of acetylene, among other things, its extraordinarily high luminosity to form an endothermic structure.

### THE SALFORD SEWAGE SCHEME.

Monday, His Honour Judge Parry, sitting at the Salford County Court, had before him the further consideration of the case of *Rey and Irwell Joint Committee v. the Salford Corporation*, as brought to restrain the Corporation from polluting the waters of the Irwell and the Ship Canal. Mr. Sutton appeared for the Joint Committee, and Mr. Roe Ryecroft for the Corporation.

Ryecroft reminded his honour that on the 10th January the Court made an order against the Salford Corporation, but suspended it from taking effect, adjourning the matter until the present day. The Corporation in the meantime to apply to the Local Government Board for sanction to borrow the money necessary to carry out the scheme of sewage purification, which they were contemplating. At the time it was expected that the works referred to would cost £100,000. Since that date a sub-committee was appointed to go into the details of the scheme. As a result of their investigations it was recommended that the Corporation should apply to borrow £50,000, so that subsidiary works might also be carried out in connection with the main scheme. The adoption of this recommendation was proposed at the Salford Town Council at its meeting in March, but an amendment was carried referring it back to the sub-committee. On the 1st of April it was again before the Council, and this time the recommendation was agreed to. On the 17th inst. a formal application was sent to the Local Government Board for sanction to borrow the money, and the Corporation was required to submit plans and all necessary details, and the Corporation waited the decision of the Local Government Board. Notwithstanding the delay in the matter, the cross resolutions of the Council, passed by the engineer and his staff had since January been busily engaged in preparing all the necessary drawings.

Mr. Sutton said that after hearing what had been done and what had not been taken by the Corporation, he would not complain. The Committee had received from the borough engineer the most complete and lavish details, so that anyone could see what was to be done. The Local Government Board would be able to ratify the decision. That board had to make the next move, and he suggested that the Salford Corporation should give notice when they received the decision of the Local Government Board to proceed with the scheme, and that then at a time convenient to all parties they should come to the court.

Judge Parry said the order he made was still in force, but no penalties were enforced at present, subject to the defendants giving immediate notice to the court and the plaintiffs of the result of their application to the Local Government Board. The matter would be adjourned until further notice was known, with leave to apply immediately for a day's adjournment should parties again come into court. Costs throughout would be paid by the Corporation.

### Trade Notes.

**CHANGE OF ADDRESS.**—We are advised by the Grasselli Chemical Company that the New York offices of this company will be removed after the 1st of May to the Sampson Building, 63 and 65, Wall-street, New York.

**MINING MORE OIL TERRITORY.**—The Standard Oil Company has acquired the property of the Rugby Colony, in the mountains of East Tennessee. This is the colony that was founded by the late Judge John Brown, who was best known as the author of "Tom Brown's School Days." The colony was an agricultural enterprise for Englishmen, and failed. The land comprises probably about 27,000 acres. It is a notion that the oil belt found in Pennsylvania and West Virginia extends through the Rugby tract. A small oil well was found there a short time ago. The Standard Oil Company is putting down a well if it does not find oil it will give up the land. It finds oil as rental one-eighth of the oil it gets out of the ground, the rest is payment under an oil lease.

**FURTHER CLAIMS FOR RÖNTGEN RAYS.**—Considerable sensation has been occasioned in American scientific circles by a claim put forward on behalf of Professors Pratt, Wrightman, and Bennett, of the Medical College, Chicago, to the effect that they have discovered that the Röntgen rays are able to kill the bacteria of cholera, diphtheria, pneumonia, influenza, glanders, typhoid, tuberculosis, and anthrax. For some time past scientific men have been working in New York on the lines of the experiments instituted with a similar object in view in Germany and Austria, but little or no result has been obtained. Details of the new claim are, therefore, awaited with much eagerness.

**RIO TINTO CO., LTD.**—The report of this Company for the year ending 31st December, 1895, states that the conversion of the Company's mortgage debt carried through in July last means a net saving to the Company of £64,000. during the year 1895. In the year 1896 and following years the saving will be £74,000, which is equal to more than 2½ per cent. on the share capital of the Company. After providing for all interest and expenses, the profit on sales of produce and other items at the credit of revenue account, including the balance brought down from the previous year, amount to £534,068, and there has been written off the extension and development account by a fixed charge on pyrites £17,860, leaving £516,208. Out of this has been provided the amount of redemption of the first, second, and third five per cent. mortgages £50,500., and the directors have written off and applied to increase of the general depreciation account £25,000., reduction of over burden account £10,000., plant gone out of use, &c., £19,531., leaving a balance of £411,177., which it is proposed to appropriate as follows:—The interim dividend of 10s. per share paid in November absorbed £162,500; to the payment of a final dividend of 12s. per share, £195,000, and to carry to the reserve fund £25,000., leaving a balance to be carried forward of £28,677. The system of exploration which the Company have all along pursued and still continue has enabled their mines manager to give an estimate of the reserves. The ore extracted during the 23 years of the Company's existence has been 23,000,000 tons, and he estimates the quantity now opened to be not less than 135,000,000, which at the present rate of output of 1,400,000 tons per annum represents enough for 97 years' work. Of this quantity it is estimated that 35,000,000 tons consists of ore poor in copper, leaving 100,000,000 tons of a quality not under the average of what has been worked in the past, or, say, 70 years' supply. This does not take into account what may be found in the masses still unexplored.

### Market Reports.

#### TAR AND AMMONIA PRODUCTS.

Benzols are steady at 1s. 11d. for 90's, and 1s. 8d. for 50/90's. Carbolic acids rather easier, 60% crude being quoted 2s. 1½d., and 40% crystals 7¼d. There is no change in solvent naphtha, but crude is easier at 8d. Pitch easy at 32s. 6d. to 33s., f.o.b. East Coast.

Sulphate of ammonia is much the same, and prices very unsatisfactory. Nearest values are:—Beckton and London outside makes £8., Liverpool £7. 17s. 6d., Hull £7. 16s. 3d., and Leith £7. 15s., all prompt. Forward business is quite neglected.

#### LIVERPOOL MINERAL MARKET.

Our market has continued very brisk. Manganese arrivals are nil, whilst considerable quantities are sold for forward delivery, and shipments are materially delayed; stocks are exhausted, and prices therefore are very strong indeed, and likely to be so for some time to come. Ground manganese continues in good demand at £8., £10., £12., and £15. per ton, according to grade. Manganiferous iron ore arrives sparingly; prices are 1s. or 1s. 6d. per ton better. Chrome ore: Arrivals continue steady; the demand is improving, and prices are well maintained. Bauxite continues in special request, and sales are being made at 20s. for first, 16s. for second, and 12s. for third quality, f.o.b. French chalk: Superfine quality is exceedingly scarce; the demand is good, especially for "Angel White" brands, and sales are being made at 65s. to 70s., 80s. to 90s., and 100s. to 110s. per ton, according to grade. Wolfram and scheelite: The market is cleared; prices therefore cannot be fixed at the moment; recent sales have been made at improved figures. Arsenic: Full prices have been paid for both prompt and forward delivery. Fuller's earth is steady at 50s. for lump, 55s. for ground, and 76s. per ton for impalpable powder. Ochres and umbers are in good request at 65s. per ton for J.C. ochre, and 40s. to 45s. per ton for prime umber. Antifriction ore is unchanged, the demand continuing steady. Pumice-stone is in more demand, especially for prime lump; prices are firm at £6. 10s. per ton for ground, and £7. per ton for superior Tenerife lump. Asbestos and

mica meet with steady sale at full prices. Bog ore: Stocks are practically exhausted; prices are improving, and as the shipping season is now commencing, large business is anticipated, the demand being very strong. Magnesite sells slowly. Plumbago: Founders' and lubricating qualities meet with a full demand at good prices: £6. 10s. to £10. per ton, according to grade, with prime Ceylon being done at £15. to £20. per ton. Carbonate and sulphate of barytes are in quiet demand, and prices are steady. Molybdenite, ceritum, euxenite, orthite, etc., are in quiet demand.

### MISCELLANEOUS CHEMICAL MARKET.

In the alkali trade values of all products are steady, and there is a moderately good demand for export, which, with some reduction in output, is preventing any undue accumulation of stocks. For caustic soda, spot delivery, quotations are as follows:—F.o.b. Liverpool, 77%, £9. 7s. 6d.; 74%, £8. 7s. 6d.; 70%, £7. 7s. 6d.; 60%, £6. 7s. 6d. per ton, 10-ton lots and upwards. Bleaching powder, £7. softwoods, makers' works, and £7. 5s. hardwoods, f.o.b., Liverpool, with some variations according to market. Alkali, 58%, steady, at £3. 7s. 6d., bags, makers' works, and £3. 12s. 6d., casks, f.o.b. Leblanc ash, 1d. to 1½d., f.o.b. Soda crystals, 32s. 6d. to 35s., bags, f.o.r. Chlorate of potash 4½d. Chlorate of soda, 6¼d. to 6½d. per lb. Recovered sulphur, £3. 12s. 6d., f.o.r. Sulphate of copper easier, at £17. 10s. prompt, and £16s. 15s. to £17. forward. Brown acetate of lime without improvement, at £4 5s., net, c.i.f. Grey acetate, £7. 10s., c.i.f. Sugar of lead slightly easier. Acetate of soda firm, at £14. 10s. In white powdered arsenic there is a rather better supply—pre firm, at £23. prompt, and £22. 10s. forward. Potash, caustic firm in price, and in good demand. Carbonate, 90/92%, £17., c.i.f. Yellow prussiate of potash, 7¼d per lb. Prussiate of soda, 6¼d. Cyanide, 98%, 1s. 2½d. to 1s. 3d. per lb. Borax quiet, and price unchanged. Nitrate of soda steady, at 7s. 10½d. per cwt. Carbolic acid crystals lower, at 7¼d. to 7½d. per lb. Ammonia muriate in good inquiry, at £22. per ton. In aniline oil and salt there is no change in price, but only little business doing. Sulphocyanides in fairly good request, and prices unaltered. Reports generally indicate a quiet state of trade in chemicals.

### REPORT ON MANURE MATERIAL.

The market is fairly steady, and there has been a considerable amount of business passing for prompt and early delivery, but the most that can be said is that prices have been about maintained. There are sellers of 75/80% Florida phosphate rock at 6d. per unit, in cargoes c.i.f. to United Kingdom ports, and of South Carolina River rock at 5½d. per unit, 1896 steamer shipment, but buyers do not seem at all keen at these prices. For summer shipment there are sellers of cargoes of River Plate bones at £3. 17s. 6d. per ton to good United Kingdom ports, but buyers' ideas do not go beyond about £3. 15s. There are now sellers of Bombay bone meal for shipment at £3. 13s. 9d per ton ex quay, and of arrived parcels at £3. 16s. 3d. For crushed East Indian bones sellers ask £4., but there are no buyers at this figure. A parcel of crushed River Plate bones on spot offers at £3. 12s. 6d. per ton. Nitrate of soda is steady, at 8s. per cwt. for fine quality on spot. Due cargoes, ordinary quality, are worth about 7s. 10½d., and summer-autumn shipment 8s. 3d. to 8s. 4½d. per cwt. Home-prepared dried blood offers at 7s. 6d. per unit, free on rails at works.

### HULL PAINT, OIL, AND COLOUR REPORT.

TUESDAY.

OILS.—Although the volume of business continues relatively good, values from one cause or another continue to recede, which circumstance damps all speculation, buyers being satisfied to buy from "hand to mouth." During the week the imports have been 34,608 quarters of linseed from River Plate, 1,360 tons of cottonseed from Alexandria, and 7,266 quarters of rapeseed from Novorossisk. Linseed oil has declined about 7s. 6d. per ton, closing dull at 17s. 7½d. naked, spot or month; May-August and September-December offer at 18s. 4½d., with buyers at 18s. 3d. Boiled and refined from £1. to £2. per ton extra. The export for the week has been 3,000 cwt. Refined cotton oil dull, with sellers at 15s. naked, spot or month; May-August offered at 15s. 6d. Crude flat at 13s. 6d. naked, spot; month worth 13s. 7½d; May-August sellers, 14s.; casks £1. and ordinary barrels 30s. per ton extra. Export of refined oil for the week, 6,340 cwt. Spirits of turpentine unchanged and firm. Olive oil quoted from £26. per ton for Spanish oil. Castor oil, 2½d. per lb for first pressure. Cod oil, from £17. to £20. per ton. Boiled siccative oil, £13. per ton. Brown Yorkshire grease, £8. per ton. American cottonseed oil soap: 70% fatty acids, £11. 5s. ex warehouse in barrels.

CAKES.—Linseed cakes quiet, but steady: 95% pure, £6. 2s. 6d. per ton; Russians, £5. 17s. 6d.; America Oil cakes, £5. Cotton cakes, firm: Best makes, £4.; second 12s. 6d. to £3 15s. Rape cakes unchanged.

PAINTS.—The season, judging from the early months of the year, promises to be very good. The home market is fully alive, intermingled with some promising enquiries from abroad. Prices are:—White and oxide of zinc unchanged; venetian red, yellow ochre, mineral black, from £3. 0 to £5. per ton, dry; oxide dry, £7. per ton upwards; red lead unchanged; red paints in tins, from £24. per ton paint remover, £1. 5s. to per cwt.

### THE METAL MARKETS.

LONDON, WEDNESDAY.—Pig iron, lower: Scotch closed at 46s. 0½d.; Middlesbrough, 37s. 10d. cash, and 47s. 9½d. Copper, quiet: Chili bars, G. O. B.'s and G. closed at £44. 18s. 9d. to £45. 3s. 9d. cash, and £45. 5s. to £46. three months. Tin, quiet: Straits closed at £59. 7s. 6d. to £59. cash, and £60. to £60. 10s. three months; Australian, £63. English ingots, £63. 10s. Lead, dull: Spanish, £10. 1 English, £11. 2s. 6d.; Silesian spelter, ordinary, £15. 12 English, £15. 15s. Nickel, 1s. 2½d. Antimony, £30. 5s. to £30. 10s. Quicksilver, lower: first hands, £6. 15s.; second hands, £6. Copper shares, quiet: Cape, 2¼ to 2½; Copiapo, 2 to 2¼; 2¼ to 3¼; Mason and Barry, 3¼ to 3½; Rio Tinto, 18½ Tharsis, 5½ to 5¾.

GLASGOW, WEDNESDAY.—Market firmer, with good Scotch done at 46s. and 46s. 0½d. cash, also at 46s. 2d., 46s. 46s. 2½d. one month; closing with buyers at 46s. 0½d. cash ask 46s. 1d. Cleveland done at 38s., 38s. 1d., and 38s. one closing with buyers at 37s. 10d. cash, sellers ask 37s. 11d. land hematite done at 47s. 9d. cash, also 47s. 11d. one closing with buyers at 47s. 9½d. cash, sellers ask 47s. Middlesbrough hematite closes with buyers at 45s. 4d. cash ask 45s. 5d.

### LIVERPOOL OIL AND COLOUR MARKET.

WEDNESDAY.

OILS.—Palm oil is dull. Some spot business has been done at £19., but for forward prices range from £18. 17 to £18. 15s. Olive is steady at £29. to £30. for Malaga, and £29. for Seville, there being small sales at these prices. Lard, firm, holders remaining steady at 19s. 9d. to 21s. per cwt. for 1 makes, in export casks. There is no change in cottonseed, refined being quoted 17s. to 17s. 6d. per cwt. Castor oil is though rather quiet: Good seconds Calcutta are quoted 2¾d. and first pressure French 2½d. to 2¾d. per lb. Tallow is doing an easier tendency, though so far prices are very slightly Resin is moving fairly well, at full figures: Common is quoted to 5s. per cwt., and fine and medium grades at corresponding Spirits of turpentine are much firmer, and have experienced advance to 22s. 6d. per cwt., with the prospect of a further Petroleum steady: American 6¼d. to 7½d., and Russian refined per gallon.

COLOURS are steady, without alteration in Ochres: Oxfordshire, common, £10., medium, £12., best Derbyshire, common, 40s.; medium, 50s., best, 60s.; Welsh 90s., seconds, 50s., and common, 18s.; Irish, Devonshire, 45s.; French, J.C., 60s. to 65s.; M.C., 65s. to 67s. 6d. Turkish quiet; Devonshire, 50s. to 55s. White lead, £16. unchanged. Venetian red, £6. to £10. Cobalt: Prepare 9s. 9d.; black, 9s.; blue, 6s. Zaffres: No. 1, 3s. 6d.; 2s. 6d. Oxide of iron: Common, £7.; medium, £10.; fine Zinc oxide, £22. 10s. to £25.

### TYNE CHEMICAL REPORT.

TUESDAY.

Chemicals are still quiet, and new business limited. Sulphur, however, are improving, and there is rather more inquiry crystals are still on a basis of £2. 2s. 6d. per ton, gross weight Sulphur steady, at £3. 17s. 6d. per ton. Caustic, 76/77%, £9. 10s.; 70%, £7. 10s. per ton.

Bleaching powder, softs, £7. 5s. per ton, nett; hards, £7. 10s. nett; caustic soda, 76/77%, £9. 5s. per ton, nett; do., 70%, per ton, nett; recovered sulphur, 2 cwt. bags, £3. 17s. 6d. per ton, nett; soda ash, 48%, £4. per ton, nett; do., 50%, £4. 3s. per ton, nett; do., 52%, £4. 6s. 8d. per ton, nett; alkali, 36%, per ton, nett; white alkali, 48%, £4. 10s. per ton, nett; do.

per ton, nett; do., 52%, £5. per ton, nett; hyposulphite of  
cwt. casks, £6. 5s. per ton, nett; do., 1 cwt. kegs, £7.  
nett; silicate of soda, 75° Tw., £2. 12s. 6d. per ton, nett;  
° Tw., £3. per ton, nett; do., 140° Tw., £3. 7s. 6d.  
nett; soda crystals, casks, £2. 2s. 6d. per ton,  
light; do., 2 cwt. bags, £2. 2s. 6d. per ton, nett weight;  
of potash, 5d. per lb., less 6%; pearl hardening,  
ton, nett; pure white sulphate of alumina, £3. 17s. 6d.  
nett; blanc fixe, £7. 5s. per ton, nett; chloride of barium,  
rystals, £6. 15s., per ton, nett; do., 90/95%, crude calcined,  
ton, nett; sulphide of barium, crystals, £4. 15s. per ton, nett;  
of alumina, £30. per ton, nett; aluminate of soda, £30.  
nett.

—South Durham salt is in rather fuller demand, at 9s. per  
Tees.

S.—There is a slight improvement in the market, and ship-  
the Baltic Ports are now commencing. Coke is very steady,  
demand at present for home consumption is quite abnormal.  
quotations are:—Best Northumbrian steam, 8s. to 8s. 3d. per  
ond qualities, 7s. to 7s. 3d. per ton; small steam, 3s. 6d. to  
er ton; manufacturing coals, quiet, 4s. 6d. to 5s. per ton; gas  
6d. to 6s. 9d. per ton; coke, firm, 15s. to 15s. 6d. per ton.

## WEST OF SCOTLAND CHEMICALS.

GLASGOW, TUESDAY.

Partial improvement in the general market lately reported, may  
have still kept, if not extended, but on the whole the better-  
y very moderate of compass. The tendency, perhaps, is still  
rather greater firmness of price, but without any positive ad-  
any case. The market continues fairly supplied with en-  
and orders about Baltic shipment, chiefly bleaching powder,  
d caustic soda. Soda crystals form the exception to the general  
ng less asked for, and tendency to a weakening of price.  
of ammonia still holds to the weary sinking process, having  
been done down to £7. 15s., spot terms, Leith. Makers are  
uzzled and disappointed with the article. Mineral oils and  
are, in the meantime, unchanged, but changes may be in pro-

Meetings of the makers are being held, one of the questions  
being whether it is worth while to continue the combination  
cers.

prices current are:—Soda crystals, £2. 2s. 6d., nett, Tyne;  
48/56°, £3. 15s. to £4. 15s. nett, Tyne; white alkali,  
4. 10s. to £5. nett, Tyne; alum in lump, £5. to £5. 5s. nett,  
caustic soda, white, 74° £8. 7s. 6d., 70/72° £7. 7s. 6d., 60/62°  
6d., and cream, £6. 7s. 6d., all nett, Liverpool; bleaching  
£7. nett, Tyne; saltcake, 23s.; borax, English,  
£20., and boric acid, £30. nett, Glasgow; bicarbonate of  
wt. casks, £6. 10s., and 1-cwt. casks £6. 15s. nett, Liverpool;  
te of potash, 4½d. nett, for Scotch and English deliveries (for  
½d. nett, f.o.b. Glasgow); bichromate of soda, 3½d. nett, for  
ad English deliveries (for export, 3½d. nett, f.o.b. Glasgow);

chlorate of potash, 5d. less 5%, Liverpool; nitrate of soda, 8s. to  
8s. 3d.; sulphate of ammonia, £7. 15s. prompt, f.o.b. Leith;  
salammoniac, first and second white, £39. and £37. nett, any port;  
sulphate of copper, £17. 15s. less 5%, Liverpool; paraffin  
scale, hard, 1½d. and soft, 1½d. to 1½d. per lb.; paraffin wax, 120°  
semi-refined, 2½d. to 2½d.; paraffin spirit (naphtha), 7d. per  
gallon; paraffin oil (burning) No. 1, 6½d., and crystal, 6½d., at works,  
for Scotch buyers (English sales about ½d. lower); ditto (lubricating)  
865° £5., 885° £5. 10s. to £6., and 890/895° £6. to £6. 10s.  
Week's imports of sugar at Greenock were nil.

## New Companies.

**Jones Bros. and Co. (Wolverhampton), Limited.**—CAPITAL  
£25,000., in £10. shares. This company has been formed to carry on  
the business of Messrs. Jones Bros. and Co. and the Enamel Sign Co.,  
at Wolverhampton, and to trade as tinplate workers and enamellers,  
etc. The subscribers to the memorandum of association are:—Mrs. S.  
Jones, Highfields, Wolverhampton; Miss E. R. Jones, Highfields,  
Wolverhampton; Miss S. A. Jones, Highfields, Wolverhampton; W.  
Hall Jones, Highfields, Wolverhampton, manufacturer; T. L. Jones,  
Highfields, Wolverhampton, builder; Mrs. L. H. Jones, Pennfields,  
Wolverhampton; B. H. Jones, Pennfields, Wolverhampton, manufac-  
turer.

**Leverett-Bake Tanning Co., Limited.**—CAPITAL £50,000., in  
£1. shares. This company has been formed to acquire a certain  
licence for the manufacture of certain goods at one tannery, under  
patent 13,195/94. The subscribers to the memorandum of association  
are:—R. Bedford, Marston, South Ealing, gentleman; E. S. Roche,  
204, Lancaster-road, W., gentleman; H. P. Spiller, 28, Hastings-  
road, Ealing, gentleman; F. Down, 18, Cornwall-road, Stroud Green,  
N., gentleman; J. Fettes, 32, St. Mary's-square, Kennington,  
gentleman; E. W. Streat, 95, Woodlands-road, Ilford, gentleman;  
C. E. Hooke, 196, Holland Park-avenue, W., gentleman.

**Wortley, Cane, and Co., Limited.**—CAPITAL £5,000., in £5.  
shares. This company has been formed to acquire and carry on the  
business of chemical manufacturers, now carried on by the Wandsworth  
Chemical Works, Limited, and Messrs. Wortley, Cane, and Co.,  
Clifford-street Works, Manchester. The registered office is Causeway,  
Wandsworth Common, S.W.

**Gallow Hill Glue and Chemical Co., Limited.**—CAPITAL  
£25,000., in shares of £1. each. This company has been formed to  
acquire and carry on the business of glue and chemical manufacturers,  
at Great Bowden, Leicester. The registered office is 36, Mark-lane,  
E.C. The subscribers to the memorandum of association are:—S.  
Symington, Brooklands, Market Harborough, merchant; Mrs. S.  
Symington, Brooklands, Market Harborough; J. Smith, Sunny Bank,  
Market Harborough, auctioneer; E. O. G. Head, Sunny Bank,  
Market Harborough, manufacturer; R. England, 36, Mark-lane, E.C.,  
chemical manufacturer; J. E. Wilson, Airton, Wood Green, N., C.A.;  
R. D. England, 36, Mark-lane, E.C., chemical manufacturer.

## THE COAL TRADE—PRESENT AND FUTURE.

THE Board of Trade returns continue to improve, and things in trade generally appear to be picking up. On all hands those engaged in industrial enterprise are beginning to take heart once more, and yet once more there is a danger of their newly-born ardour being prematurely damped.

When trade was fairly good the last struggle in the coal trade played sad havoc, and a similar strife would be well-nigh disastrous to trade in its present state of convalescence, yet there is unfortunately good ground for the belief that we are fast approaching another important crisis.

The arrangements fixed by the Board of Conciliation come to an end in July next, and, though the miners and employers both seem to favour the continuance of the Board, it is highly probable that there will be considerable difficulty in arranging the precise functions of the Board in the future. The masters want a kind of sliding scale, to which the men are most determinedly and unanimously opposed. The proceedings at the Nottingham Conference this week show this very clearly. The employees want the rate of wages to remain as they are until January, 1898, and for the Board to have full power between January and August in that year to raise wages to the extent of 15 per cent. The masters will doubtless make a great point of the competition they are suffering in the Federation districts from the non-Federation owners in South Wales and the North country, but the men recognise this also, and evidently consider it is merely an off-set against their own misfortunes in the matter of wages. It is very evident, however, that the closing of the Durham pits in no way terrorised the men in Lancashire and Yorkshire, but, if anything, made them all the more resolute in resisting the reduction in wages which the step was supposed to foreshadow. There are, of course, two sides to the question, but if their figures are dependable it is certainly a strong point to be able to show that a lowering of wages has not resulted in greater prosperity in trade. At present the masters seem to be holding their hand, and although the gravity of the questions under settlement had caused the Board to adjourn once, it was generally felt that nothing like a definite solution of the situation would result at the adjourned meeting held on Thursday, which feeling was evidently correct.

There is, however, another departure looming in the distance, and it is to be hoped that in discussing their points of difference, both men and masters will take cognisance of its probable bearings on the future. We refer to the recent developments in connection with the coal industry in Kent, which have taken definite form in the shape of the Kent Coalfields Syndicate, Limited, with a capital of £200,000.

The history of the Kent coal seams is interesting. In 1875 it was clearly shown that there was abundance of presumptive evidence in favour of the existence of coal in this

county, and the depth was estimated at 1,000 to 1,200 feet. In 1890 this evidence was put to the test, and we took occasion to refer to the possibilities and probabilities of the situation, when it was found that a 2ft. 6in. seam of coal actually did exist near Dover at a depth of about 1,200 feet, and that it was, moreover, good house coal. Since that time the boring has progressed, and has revealed the fact that as many as twelve seams, seven of which were thick enough to pay for working, were situated at lower depths; and finally culminated in the discovery of a 4-ft. seam of excellent coal at a depth of 2,200ft. Some time elapsed between the successful termination of the boring experiments and the present effort to turn the same to commercial advantage but it has now been made, and certainly promises well.

The depth is acknowledged to be above the average, but then the boring has shown that both the *strata* and absence of water troubles are favourable to the successful sinking of deep shafts. Moreover, to do so is not attempting the unknown, for there are pits in this country of 3,000ft. and upwards, while in Belgium pits 3,800ft. deep are being worked daily.

Of course, it is very easy to indulge in day dreams about the rich harvest the new syndicate will probably reap, but leaving such matters to those who have a taste for the deceptive imagery of the brain, and, confining ourselves to hard and uncompromising facts, it is very evident that the syndicate means business, and on a profitable basis. It has gone about the task of acquiring freehold rights in a most discreet, not to say actually secret manner, and in consequence their purchases have been made on much more advantageous terms than if it had been generally known that the outcome of the acquisition of the freehold would be the formation of a company to exploit the coal seams beneath.

Immediate steps are being taken to sink two 20 ft. shafts into the 2 ft. 6 in. seam, close to the Shakespeare's Cliff boring, which will thus be reached at 1,138 feet. Concurrently the latest plant will be provided capable of winding 2,500 tons per day.

Judging by comparatively recent experience in Fifeshire, therefore, we have every reason to assume that before the expiration of the proposals now being considered by the Board of Conciliation, this new coalfield will be actively at work, and competing vigorously for its share of commercial support—a fact that we trust will be duly reckoned with when considering the future rôle of this Board.

**SOCIETY OF CHEMICAL INDUSTRY.—London Section.**—The next meeting of the Society will be held at Burlington House on Monday, May 4th, at 8 p.m., when a paper will be read by Mr. Wall on "The Reproduction of Colour Photography," and by Messrs. Cross and Bevan on "Artificial Silk."

**SOCIETY OF CHEMICAL INDUSTRY.—Liverpool Section.**—The last meeting of the Session will be held on Wednesday, May 6th, in the Chemical Laboratories, University College, at 7 30 p.m. There are a number of miscellaneous communications to be presented, while two papers will be read, one by Mr. Orsman on "The Interaction of Carbon Monoxide and Coal Dust," the other by Dr. G. C. Clayton on "Chlorine as a Disinfectant."

**SOCIETY OF CHEMICAL INDUSTRY: Manchester Section.**—The May ordinary meeting of this Section has been postponed until Friday, May 8th, when a discussion of all the papers read before this Section during the Session will be opened by the Chairman at 7 p.m. The papers to be discussed will be found in the journals of the Society for January, February and March. Any member who was present at the reading of these papers, and who cannot attend the discussion, is invited to send any remarks he may wish to make (with a view to publication) to the Chairman at Sandilands, Knutsford, by May 7th.

## Our Book Shelf.

**CYANIDE PROCESS.** By E. B. Wilson. 113 pp. London: Chapman and Hall, Limited. 1896.

This little work aims at providing a review of the present position of the cyanide process, and the various methods that have been tried for the practical winning of gold by the aid of cyanide alone, or in conjunction with electricity.

The chapters on stamp mill work, treatment of bullion, and laboratory work are especially good. The electrolytical processes are dealt with in five separate chapters. The aim of the book is carefully set forth by the author in his introduction, and the explanations therein palliate largely the one-sidedness of the book in some places.

As a review of the cyanide process we can recommend the work to all interested in gold extraction, either in a mining or chemical capacity. It is scarcely so successful or reliable when considered as a review of the patent literature connected with the evolution of the cyanide process, as there is no mention of the Sulman improvements and other latter-day developments. As a whole, however, it may safely be classed as a work of use and merit, well worthy the attention of all users of cyanide processes, for the recovery of gold.

**PRACTICAL INORGANIC CHEMISTRY.** By G. S. Turpin. 156 pp. 61 woodcuts. London: Macmillan and Co. 1895. 2s. 6d.

This elementary handbook is framed upon lines parallel with those followed in the new syllabus of the Department of Science and Art, and evidently aims at teaching chemistry by inculcating experimental investigation and independent observation.

The illustrations are novel and good, as they represent actual apparatus that can be put together by the student in an ordinary laboratory, and are not idealistic pictures. For this reason alone they are more or less educational factors.

After a course of physio-chemical experiments a study of the chief elements and compounds is outlined, everything being taught by a series of exercises to be performed by the student. The deductions are drawn from the student by interrogatory queries, which either conclude or are interpolated in the description of the experiment. The book is therefore exceptionally suited for the use of students who are not wholly self taught.

At the end a description of the chief qualitative tests for the metals is given, along with a scheme of analysis which is not an advance upon the prevailing schemes now in vogue, save in one exception. The student has to prepare all his salts before testing them, and it is a fact that under many of the present systems of chemical education a great number of young but budding chemists are very much at sea when they have to prepare pure salts for themselves. In many respects, therefore, this handbook is a decided improvement upon the average text book of its kind, with which the educational world is lamentably overdone.

**CHEMISTRY FOR ENGINEERS AND MANUFACTURERS.** By H. Blount and A. G. Bloxam. Vol. I. Chemistry of Engineering, Building and Metallurgy. 244 pp., including index. 35 illustrations. London: Charles Griffin and Co. 1896. 10s. 6d.

The book is divided into two parts, the first of which covers the chemistry of constructional materials, sources of energy, steam raising, lubricants and lubrication. The second part deals with metallurgy. The work is essentially a carefully condensed compilation, but in many cases the subjects benefit by this second handling. Thus while elaborate details are avoided a sufficient explanation is given of all the underlying principles of the processes dealt with.

All the sections in the first part are good, especially that on lubricating oils. Stress is advisedly laid on the necessity of specifying the conditions under which the test for flash-point is made. In reference to the measurement of high temperatures, there is much useful information, and the tone of the whole is moderate. The first part also contains a practical and helpful comparison of the efficiencies and preparation of producer gas, water gas, and semi-water gas. The metallurgical section of Part II. is very apparently a digest of Bloxam's well-known work on this subject, and this of itself is sufficient recommendation. Doubtless the method of treatment must be held responsible for the absence of any mention of the electrolytic production of manganese, while we notice that although there is a reference to the Luce-Rosan process of desilverising lead, no mention of the process is made, save in connection with the familiar Pattinson process. Apart from a few such *minutiae*, this first volume is undoubtedly a welcome and fitting harbinger of what should be a still more welcome and interesting completion of the work in Vol. II.

## The Patent List.

This list is compiled from Official sources in the Manchester Laboratory, under the immediate supervision of E. Davis and Alfred R. Davis, who report professionally value of Chemical Patents.

### ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

Abstracts are specially prepared for the Chemical Trade Journal, RIGHTS of publication are RESERVED. This is the earliest abstracts of Chemical and allied patents accessible to the

nents connected with the Electrolysis of Chlorides and other and the Evaporation of Brine and other Solutions. H. Tee, Castle-street, Liverpool. Eng. Pat. 6,565. March 30, 1895.

ject is to make the same fuel first evaporate brine and raise high provides power for the generation of electricity, and sub- evaporate more brine in open pans. first place, therefore, closed pans are heated direct, whereby concentrated, and the salt formed is constantly raked out by al means. The steam thus generated is conveyed to a low- engine, which drives a dynamo and a vacuum pump. The rom the engine passes to a condenser, which is really a series laid in shallow open pans, by which means the necessary or the engine is obtained, while more brine is concentrated removal to the closed pans. In order to maintain as good a us possible, water and air are constantly exhausted from the r pipes by the small vacuum pump previously referred to. gases from the closed pans are passed through flues under y open salt pans before passing to the uptake. There are wings

nents connected with the Electrolysis of Chlorides and other and the Evaporation of Solutions. H. Tee, 51, Castle-street, ool. Eng. Pat. 6,565a. March 30, 1895.

s a modification and amplification of the foregoing patent, rs mainly in the generation of the steam in high-pressure say 150 to 200 pounds to the square inch, which steam is used - pressure engine and then passed to closed salt pans charged e. The heat of the steam is thus utilised, while the steam from the closed pans is conveyed to the open pans (described receding patent), where the brine is evaporated at a lower re and coarser-grained salt obtained. Otherwise this patent ntially the same as the above. There are four descriptive

nents in the Manufacture of Zinc Chloride and other Metal lides, applicable also to the Manufacture of Acetate or Sulphate ic. C. H. Hoepfner, formerly of 36, Frankfurterstrasse, Giessen, now elgoländer Ufer, Berlin, Germany. Eng. Pat. 7,560. April 13, 1895.

ulphide ore, such as blende, is heated with a mixture of ric and nitric acids in the presence of air, the acids being of portions, temperature, and concentration as to prevent the of the sulphur liberated, and to prevent the reduction of the es to nitrogen or nitrous oxide. The reaction is represented place thus:—

The resulting solution is said to contain from 10 to 20 % of zinc as chloride, which is purified by freezing after neutralisation. If sulphates are required sulphuric acid is substituted for hydrochloric acid. In an analogous manner chlorides of lead, nickel, and iron may be prepared. It is claimed that the free sulphur that results adds greatly to the economy of the process. It is generally advisable to treat the materials first with HCl or H<sub>2</sub>SO<sub>4</sub> so as to dissolve soluble oxides and sulphides, thereby saving nitric acid.

Process for Bleaching Paper Pulp. F. Stehle, 83, Fabrikstrasse, Coeslin, Germany. Eng. Pat. 10,716. May 30, 1895.

The pulp is first treated in the usual way with a small quantity of bleach, so that only a partial bleaching is effected. The pulp is then pressed until it contains about 50 % of moisture, placed in an air-tight receptacle, and treated with chlorine gas. On being taken out of the receptacle it is claimed that a degree of whiteness hitherto unknown is obtained. The process is said to be particularly suitable for certain kinds of rag pulp, and to effect an economy in bleaching material as well as yield a firmer fibre.

Manufacture of Sulphocyanides from Nitrites, Bisulphide of Carbon, and Sulphuretted Hydrogen. O. Imray, 28, Southampton Buildings, London (communicated by Goerlich and Wichmann, 32, Ferdinandstrasse, Hamburg). Eng. Pat. 11,287. June 8, 1895.

It has been found that a satisfactory reaction takes place when one molecule of potassium nitrite, one molecule of carbon bisulphide, and two molecules of sulphuretted hydrogen are heated to about 120° C. in a closed vessel fitted with an agitator. It is advantageous to use the sulphuretted slightly in excess of the theoretical quantity, so as to ensure a complete decomposition. It is advisable to use the nitrite in the form of an aqueous solution. The yield of sulphocyanide and sulphur is claimed to be practically the same as that shown by theory. The sulphur separates in a fused state, cooling into a crystalline crust. The final decomposition is expressed as follows:—

Process for Decomposing Sulphuretted Hydrogen, and Obtaining Ammonia, Compounds of Ammonia, Oxysulphides, Sulphides, and Sulphur. O. Imray, 28, Southampton Buildings, London. (Communicated by Goerlich and Wichmann, 32, Ferdinandstrasse, Hamburg.) Eng. Pat. 10,931. June 1st, 1895.

Sulphuretted hydrogen is decomposed into caustic soda and ammonia, or into ammonium and sodium sulphide compounds by passing the gas into a solution of sodium nitrite. The resulting products depend upon the proportion of sulphuretted hydrogen to the nitrite. Three molecules of hydrogen sulphide to one of nitrite give the former compounds, and five to one the latter series. In each case free sulphur is formed. The re-action is slow at first, but increases as alkaline sulphide is produced. If a portion of the sulphuretted solution is added to a fresh solution of nitrite, the absorption is rapid from the start. In this way gases may be freed from hydrogen sulphide.

## USE OF CALCIUM CARBIDE FOR MOTORS.

AN interesting paper recently appeared in the *Jour. f. Gasbeleuchtung*, in which the use of calcium carbide as a source of acetylene for motors is dealt with by Dr. A. Frank. He suggests that the solid carbide can be used to greater advantage, since it yields the gas so readily with water, and is preferable to acetylene in a compressed state in cylinders. He states that both the Bitterfeld and the Neuhausen works have improved their products up to 90 per cent. yields, and that now a price of 90s. a ton does not look at all unlikely. The theoretical yield of acetylene is 26lbs. per 64lbs. of carbide, and the extra weight, that of the calcium, is a small matter in comparison with the expense and risk of 50 atmosphere cylinders. Curiously enough, the liquefied acetylene obtainable from a quantity of carbide occupies, as nearly as possible, twice the volume of the carbide itself. The data arrived at are, for a 1,000 horse power marine engine worked for 600 hours: Coal, at 1'54lbs. per horse power per hour, 420 tons, occupying a space of 420'430 cubic meters; liquid acetylene, at 0'396lbs. per horse power per hour (Ihering and Slaby), 108 tons, filling cylinders of an aggregate capacity of from 270 to 300 cubic meters, and of sufficient strength to withstand a pressure of 50 atmospheres; carbide of calcium 90 per cent., or 36'56 per cent. of acetylene by weight, total required, 300 tons, occupying 131 cubic meters only. In the last case the necessary protection from damp, etc., would not bring the space occupied up to 150 cubic meters. This is certainly a very remarkable comparison in view of cases where storage capacity is all important; for the whole of the steam boilers would at the same time disappear; but, of course, in the meantime the price of carbide stands in the way of the practical adoption of acetylene for motor purposes.

## Legal Intelligence.

### CHANCERY DIVISION.

#### HIGH COURT OF JUSTICE.

(Before Mr. Justice Chitty.)

FAB. DE PROD. CHIM. DE THANN ET MULHAUSE v. DOMEIER AND COMPANY.

Appearing for the plaintiffs, on a motion of judgment on admissions in the pleadings, Mr. Byrne, Q.C., said that the defendants, by their solicitor's letter of the 21st January, 1896, consented to an injunction and also agreed to pay £50. They submitted that in these circumstances the action was wholly unnecessary, or alternatively that its continuance was unnecessary. The defendants, whilst denying liability, had paid £50. into Court, which they said was sufficient to satisfy the plaintiffs' claim. The action was brought in respect of alleged infringement of a method for the manufacture of a substitute for musk, the letters patent for which was granted to Emil Schnauffer and Albert Baur. On the admissions in the pleadings he now asked for an injunction and £50. damages and costs.

Mr. Justice Chitty: You could not have got an injunction except by applying to the Court.

Mr. Byrne: No.

Mr. Farwell, Q.C., who appeared on the other side, said the defendants had offered to consent to an injunction.

Mr. Byrne: Yes, and I am willing to take it, but the defendants, in a letter, say that the injunction must not be advertised or their name made public in connection with this matter. Nothing about that was mentioned in the pleadings.

Mr. Farwell: That is the whole of the point between us.

Mr. Justice Chitty: By your pleading you waive conditions.

Mr. Farwell: By letters we made conditions.

Mr. Justice Chitty: You waive conditions.

Mr. Farwell: If your lordship thinks so I ask leave to amend the pleadings.

Mr. Justice Chitty: As the defence stands it is as clear as the light of many days. You do not ask leave to refer to the letters in the pleadings. In the pleadings you state an absolute offer. If I give you leave to amend what will happen?

Mr. Farwell: The injunction is subject to their undertaking not to advertise.

Mr. Justice Chitty: If I give you leave to amend plaintiffs might want to amend their motion. I should make you pay the costs of the motion.

Mr. Farwell: Would you do that after the letter?

Mr. Justice Chitty: Yes; I will give you leave to amend on the terms that you pay the costs of the motion.

Mr. Byrne said he would not resist the application to amend, but he asked for the costs of the motion.

Mr. Justice Chitty: I give leave to Mr. Farwell's clients to amend, and I order them to pay the costs of the motion.

Mr. Younger appeared for Mr. Charles Julius Casper, who, it was stated, had admitted liability to indemnify defendants, and who had obtained leave to defend the action.

## INDUSTRIAL DEVELOPMENT IN JAPAN.

THE emancipation of the Japanese from their dependence upon foreign nations for the necessities of life and manufactured goods is, undoubtedly, proceeding rapidly. In connection with textiles the progress has been most pronounced, but in many other ways the same fact is manifested.

Industrial development is largely due to the active instrumentality of Prince Shimazu. Owing to his acquaintance with certain Dutch scientists he built a laboratory on his estate, and devoted his attention to photography, telegraphy, the manufacture of glass and gas. Subsequently he built up an arsenal and foundry combined, in which experiments on explosives were made, and guns manufactured. The work was done under his own personal supervision, with the assistance of Dutch chemists. Hearing that much was to be learned from books, a retainer was sent to Nagasaki to procure all the books obtainable about chemistry and other scientific subjects. These were translated as fast as they came by a schoolmaster who had learned English. An order was also left to the effect that a copy of every scientific publication of importance was to be forwarded in the future. As is usually the case, old methods and hand labour are fast being supplanted by modern processes and machinery. The older artisans remain staunchly conservative, but their resistance is futile, as the rising generation are rapidly falling in with the new régime.

Strikes are not quite unknown, though there have only been two of importance so far. One of these occurred among a railway construction gang, who were hired for certain wages to work six days a week, and were required to work seven without additional compensation. When their protests were unheeded they laid down their tools, and appealed to the police authorities for the enforcement of the law which makes six days a week's labour, and provides that no employee of the Government or any corporation or private individual shall be compelled to work more than six days in a week without extra compensation. Sunday is the usual day of rest in Japan. Its selection is not due to law nor to religious scruples, but to public convenience and perhaps, of respect to foreign nations. When what is known as the six-day law was passed the Government set the example by closing its offices on Sunday, and all other institutions followed suit. That law was originally suggested for sanitary reasons.

The second strike in Japan occurred in Tokio in the summer of 1895. A party of bricklayers engaged in building a factory near Tokio had their hours of labour extended from 12 to 13, because of a desire on the part of the management to complete the job and start the machinery as soon as possible. The men did not object to this increase of time, but asked a corresponding advance of wages, and, as the contractor refused, they left work. He got other bricklayers to take their place, but they were induced to abandon him also, and as he persisted in his refusal to do what the men considered simple justice, it was decided to send emissaries to all the other bricklayers in the city and ask them to join in a sympathetic strike. Public sentiment was aroused by the disturbance, and the contractor who caused the trouble finally compromised with his men and went back to 12 hours' work for 12 hours' pay.

The first genuine foreign factory to be established in Japan was the Osaka Tokei Seizo Kubushiki Kwaisha, familiarly known as the American Watch Company. It was started on 1st January, 1895, and turned out its first finished watch on 10th April. The organiser and promoter of this company was Mr. A. H. Butler, of San Diego, California, who took an outfit of watch-making machinery to Japan, and induced a number of jewellers and watch dealers in Osaka to furnish £33,000 capital to pay the cost of a building and the running expenses of the business.

The highest wages paid to the skilled native workmen in the factory are only 40 sen a day, which is equivalent to 10d. in English money. The lowest wages are 10 sen (2½d.) a day. The capacity of the factory when fully in operation will be 150 watches a day, and owing to the low price of labour, they can be sold at a profit for 50 per cent. less than the market price in Western countries.

A considerable amount of machinery, notably for mining purposes, is being made, but matters are being pushed further, for the Japanese Government recently arranged for the establishment of a steel foundry in Japan with the firm of Sir W. G. Armstrong and Co., of London, on the following terms:—The materials at present to be imported from England; not more than 20 per cent. of the workmen to be English, the balance to be Japanese; if a new arm is invented in England it is to be manufactured also at the Japanese works; a subsidy is provided for a stated number of years, at the expiration of which period the Japanese Government will acquire the works by purchase.

The secret of success lies undoubtedly in large measure in the thoroughness of the people themselves, either in trades or agriculture. For instance, they make all the woodwork about their houses by hand, and most of their houses are entirely of wood. They are very skilful in all kinds of cabinet and joinery work. Their hand-made tools are well adapted for doing close work, and are kept very sharp; besides, they give a great deal more labour and patience to an article than foreign carpenters and cabinet makers. You never see scratches from nicked tools on their planed work. They use very few nails, but mortise almost everything. It is usually so well done that it is difficult to detect the joints, except by the grain, and it lasts for ever. Some of their ships are made without a bit of iron in their composition—everything is mortised.

Every variety of agriculture is carried on, and the soil is in constant use. A couple of acres is considered a large tract of land for farming purposes. Most of the farms are of smaller area, and the crops are greatly diversified. Upon such a little spot of land will be grown almost everything known to the vegetable kingdom—a few square feet of wheat, barley, corn, and millet; a plot of beans perhaps 10 feet wide by 20 feet long, an equal amount of potatoes and peas, and a patch of onions, about as big as a grave; beets, lettuce, turnips, sweet potatoes, and other varieties of cereals and roots occupy the rest of the area.

The farmer overlooks his growing crop every morning, just as an engineer will inspect the movements of his machinery, and if anything is wrong remedies it. If a weed appears in the bean patch he pulls it up; if a hill of potatoes or anything else fails it is immediately replanted. And when he cuts down a tree he always plants another to take its place. The artificial forests of Japan cover many hundreds of

square miles, and by this accuracy, economy, and care the prosperity of the country is permanently assured. As one crop is harvested the soil is worked over, fertilized, and replanted with something else.

The largest area of agricultural land in Japan is devoted to raising rice, perhaps as much as nine-tenths of the whole, and as that crop requires a great deal of water, the paddy-fields are banked up into terraces, one above the other, and divided off into little plats 25 or 30 feet square, with ridges of earth between them to keep the water from flowing away when they are flooded. All farming lands are irrigated by a system that is a thousand years old. Some of the ditches are walled up with bamboo wickerwork and some with tiles and stone.

### BONE-CRUSHING MILL.

THE steaming of bones with a view to degreasing them before grinding to meal is a process familiar to all connected or acquainted with the fertiliser trade. The digesters of Mr. W. M. Fuller, Jun., of 88, Great Charles-street, Birmingham, for this purpose have long been known to the trade and extensively used both in this country and on the Continent.

In connection with this process there has long been a want for a mill capable of crushing, but not grinding, the bones to a convenient size before degreasing them, and such a mill we now have an opportunity

of the Bill would, he believed, lead to a very general adoption of carriages propelled by mechanical power, and he was informed that at this moment there were persons prepared to put upon the streets of London electrical omnibuses, which, they maintained, would be as safe and convenient in every respect as the existing very popular means of locomotion. With regard to the clause relating to the emission of vapour, he was informed that it was impossible to make a machine which, in some conditions of the atmosphere, would not emit visible vapour, and perhaps the President of the Local Government Board would take this into consideration and introduce some amending words. There was, he thought, a very earnest desire in the country that a Bill of this kind should be passed, and although the Local Government Board were bound to admit that they had drawn this Bill, so to speak, in the dark, owing to the fact that they had had no experience of light locomotives in this country, they believed that the Bill would meet the objections that had been raised to the law as it at present existed, and, at the same time, would give opportunities to manufacturers of experimenting with these machines and possibly of improving them.

Viscount Clifden, while not opposing the Bill, regretted that these mechanically propelled machines were not to be permitted to draw other vehicles. This he considered a great flaw in the Bill, as the machines might otherwise prove of great use to farmers and others in conveying produce and for other purposes.

After some observations from the Earl of Morley, the Bill was read a second time.

BONE-CRUSHING MILL.

of introducing to our readers. The mill is shown in our illustration, and, having been specially designed for the purpose, has been put upon the market by Mr. Fuller, Jun.

There is, therefore, no longer a lack of a mill that will simply crush the bones into comparatively large pieces suitable for extraction, while, at the same time, the use of the mill commends itself on the score of economy, as by this preliminary crushing the degreasing of the bones is effected with greater ease and efficiency.

## Parliamentary Jottings.

### THE LEGALIZATION OF AUTO-CARS.

In the House of Lords last week, Lord Harris moved the second reading of the Locomotives on Highways Bill, which enacts that any Act at present in force restricting the use of locomotives on highways shall not apply to any vehicle propelled by mechanical power if it is under two tons in weight unladen, is not used for the purpose of drawing any other vehicle, and is so constructed that no smoke or visible vapour is emitted therefrom. The Bill was, he explained, a legacy from the late Government, and undoubtedly there was something peculiar in the state of the law relating to locomotives when two Governments thought the matter sufficiently urgent to call for special legislation. Horseless carriages were extensively used on the Continent, but their use in this country was at present hampered by the restrictions which prevailed under the present law. It was somewhat ludicrous that the same provisions should apply to a locomotive of, say, fourteen tons as to one weighing a few hundredweight. The passing

### BUTTER ADULTERATION AT BURY.

In the House of Commons last week, Lord Balcarras asked the Home Secretary whether his attention had been called to a case which came before the borough bench of Bury on the 6th of March, in which the bench refused to grant a summons to the purchaser of adulterated butter, on the ground that the samples had not been submitted to their borough analyst, but to a county analyst; whether he was aware that the town clerk of Bury appeared before the borough bench to oppose the granting of such summons on the same ground; whether the action of the purchaser in relying on the analysis of a county analyst was regular; and whether a borough bench was justified in refusing to deal with a case of adulteration merely on the ground that the analysis had not been made by their borough analyst.

Sir M. Ridley: My attention was first called to this case by the question, but I have communicated with the borough justices, and understand that the facts are as stated in the first two paragraphs. The purchaser subsequently produced a certificate from the borough analyst, and obtained the summons. Whether the magistrates were justified in their action depends on the construction which should be placed on certain sections of the Sale of Food and Drugs Act, 1875. That is a question which can only be authoritatively decided by the court, and on which, therefore, I must decline to express an opinion.

IMPROVEMENT IN THE SALT TRADE.—There has recently been a considerable revival in the Hartlepool salt trade, which languished somewhat during the winter months. At the Greatham works orders have just been received for several large shipments at West Hartlepool, including a cargo of 2,000 tons for India. The workmen, who had been working on half-time, are now in full employment.

## ANTI-PETROLEUM MONOPOLY MOVEMENT IN GERMANY.

THE German Government has already taken the preliminary steps in fighting the foreign petroleum monopoly. The first sessions of the committee appointed to inquire into this matter were held the latter part of last March in the Ministry of the Interior at Berlin. These sessions, however, were only of informal character, and besides the commissioners of the different departments none but experts took part in the deliberations. The chairman of the committee, Dr. Rothe, announced that representatives of commerce and industry would be invited to appear before the committee. The subject will be considered thoroughly, and all parties interested will have ample time and occasion to express their opinion. The purpose of this inquiry is to promote the establishment of a German refining industry by means of suitable tariff regulations. Austria will gladly welcome a new condition of things in Germany. The Galician producers will find a valuable market for their crude product in Germany. Russia will hardly play an important part in supplying the German refineries, as an oil burdened by 65 per cent. of residue could not very well be imported with profit. Thus America would again be the principal source of supply, but in regard to crude oil it is not the Standard Oil Company alone, for the independent producers will compete strongly with this company. Enough German capital will be found to establish refineries, and very little fear is entertained that they would be swallowed up by American refineries, which would probably be erected in Germany. The German oil fields are not so insignificant as is often believed, and the production may be greatly increased by rational methods. Galicia will develop enormously if the German market should be opened to its crude product. Roumania, too, has some chances, yet its participation in supplying Germany will depend upon the prices of the crude oil; it certainly will be obliged to look for new markets, as its export to Austria-Hungary is limited to a certain quantity by treaty.—*Chem. Tech. Zeit.*

## THE MINERAL OIL INQUIRY.

THE Select Committee of the House of Commons in hearing further witnesses had before them Sir Courtenay Boyle, Permanent Secretary to the Board of Trade, whose evidence was to the effect that the law required strengthening in order to guard against the dangers in the carriage of petroleum, and suggested for that purpose legislation on the lines of the Inflammable Liquids Bill, which was brought in originally by Mr. Home Secretary Matthews, especially sections 19 and 20, which provide for control over the transit of petroleum in ships, canals, and railways. The importation of petroleum in tank ships was largely on the increase, while importation in barrel was largely on the decrease. The present Act gave the department no power whatever over a ship after the cargo was discharged, and, therefore, they were unable to make or confirm by-laws for the cleansing of a tank vessel from inflammable vapour, which he believed to be a source of great danger. For this legislation was necessary. With regard to the conveyance of petroleum on railways, American oil companies were having wagons specially built for the carriage of their oil on British railways, but, of course, the Board of Trade had no control over these wagons. He was not aware that there had been any accidents on British railways from the carriage of petroleum.

Mr. G. F. Lyster, C.E., engineer-in-chief to the Mersey Docks and Harbour Board, described the arrangement which he designed for the storage of petroleum on the dock estates at Liverpool and Birkenhead. Superintendent Tozer, chief of the Fire Brigade of Birmingham, stated that in that town the common use of petroleum had led to an increase of fires, especially in small retail shops where petroleum was sold. Lamps had been the most common cause of fire. There was no supervision over these small shopkeepers; he had found oil stored in an underground kitchen near a fire-place. There ought to be supervision over these places. The lamps which had been the chief cause of accidents were of a cheap and fragile character, and could be bought from 6d. upwards. The present standard of 73 degrees flash-point was, in his opinion, much too low for oil kept in a heated room in a small cottage. It ought to be not less than 100 degrees. Inspector Jarrett, chief of the Explosives Department of the Birmingham Corporation, gave confirmatory evidence, and favoured, among other things, extending the powers of the Petroleum Act to the sellers of all classes of petroleum, inspection of the conditions under which it is stored, limitation of the quantity, and the prohibition, after due notice, of the sale of lamps except such as comply with specifications approved by the Secretary of State.

Mr. James H. Gough, secretary to the Thames Conservancy Board, explained the bye-laws laid down by the Conservators with regard to vessels carrying petroleum. These regulations applied only to petro-

leum spirit. The Conservators attached special importance to the ventilation of vessels. General regulations should be framed by the Board of Trade for the guidance of all local authorities. Captain Burnett, chief constable of Wolverhampton, insisted on the great danger arising from the use of cheap lamps, and suggested that all lamps should be stamped. The flash point should be raised to 100 deg. F. Inspector Moncreiff, of Portsmouth, an inspector under the Petroleum Act, said that where the oil or spirit was stored in large quantities it ought to be removed at least 500 yards from dwelling-houses. The raising of the flash point to 100 deg. F. would be some protection against lamp accidents; but he thought it would be impossible to carry out the suggestion to stamp lamps.

Mr. Boverton Redwood, analytical chemist and consulting adviser to the Corporation of the City of London, as the local authority for the city under the Petroleum Acts, in the course of his evidence, described the results of a protracted inquiry carried out some years ago by Colonel Majendie, of the Board of Trade, and himself, as representing the petroleum trade, as to the manner in which the trade was conducted at that time both at home and abroad. It was beyond dispute that they visited in the United Kingdom many places where the storage of mineral oil was carried on under conditions which were undoubtedly dangerous from the point of view that, in the event of the oil becoming involved in a conflagration, there was nothing to prevent the burning liquid from flowing out and destroying neighbouring property. In some instances also the retail sale of the oil was not carried on in a prudent manner. He very much questioned whether the kerosene trade in some parts of the United States could be carried on if the regulations were strictly enforced. He should be sorry to see any scheme passed which could not be rigidly and impartially carried out. Kerosene was a generic term applied to mineral lamp oil. It was first employed in America, but its use had been extended. It was not usually applied to oil derived from Scotch shale, but it was applied to lamp oil manufactured in Russia. It really meant what was known in England as petroleum. The legal definition of petroleum differed from the trade definition, and in order to remove misconception it became the general practice in the trade to employ the term petroleum oil to describe the mineral lamp oil of commerce. With regard to the question of raising the legal flash-point standard, he said his own experience had led him to the opinion that the subject of lamp explosions and proper flashing point did not readily admit of experimental elucidation. Deductions drawn from the comparatively few experiments that could be made might be misleading. Experience had shown that explosions might occur with oil of more than 100 degrees flashing point. It was true that such cases were rare, but they might have been more frequent if such oil had been more largely used under the same conditions as oil of lower test. He suggested that if the Committee would move the Government to apply to the German Government for a report of a recent investigation into lamp accidents and flashing point in Germany, much valuable information would undoubtedly be placed at their disposal. The report in question had not been published, but, though the report might be a private one, he had no doubt the German Government would be willing to lend it for the private use and guidance of this committee. The Chairman said he was much obliged for the suggestion. The witness went on to state that lamp explosions would still be liable to occur with some lamps if a limit of 100 degrees were adopted, and he very much doubted whether raising it to 120 degrees would eliminate the risk. Very much depended on the lamp, and still more on the manner in which the lamp was used. A shade on a lamp very much increased the heat of the oil. Nor was it always the case that the oil became hotter in a metal lamp than in a glass one. Lamps were often used in heated rooms and kitchens where cooking was going on. He remembered investigating a case of a lamp explosion in which the lamp, a glass one, was suspended from the kitchen mantel-piece in front of a fierce fire, even during the day-time, to enable the cook to watch the contents of the saucepans. He believed that simple exclusion from this country of the dangerous lamps made abroad would do much to put an end to lamp explosions. If it was thought subversive of free-trade principles to prohibit the importation of all mineral oil lamps, the inspection of such lamps at the port of arrival to ascertain whether they conformed with certain recognised principles of construction would be a comparatively simple matter. Another aspect of the question which the witness put forward was that, if the standard of flashing-point was raised to 100 or 120 degrees Fahrenheit, the existing sources of supply would be inadequate and the price must go up.

STAMPING PATENT FORMS.—Mr. Jackson, who has been in correspondence with Sir H. Reader Lack, the Controller of the Patent Office, with reference to the stamping of patent and other forms at Inland Revenue offices in the provinces, received the other day a letter informing him that the Board of Inland Revenue have authorised their officers at Leeds to stamp in future any patent, design, and trade-mark forms which may be presented to them by the public for that purpose.

## PRESERVING IRON FROM RUST.

At the last monthly meeting of the Derby Society of Engineers, a paper was read by Mr. F. J. R. Carulla on "The preservation of iron rust." The author illustrated the importance of the subject by the fact that such enormous quantities of rust—exceeding 20 tons by weight in 1866—were taken out from the Britannia Bridge that if that structure would have been doomed to crumble into the sea below. Again, from the new line to London steel and iron were excluded wherever practicable, chiefly owing to the expense that their maintenance entailed. This was not an encouraging prospect for the iron trade or to mechanical engineers. Mr. Carulla went on to deal with the causes of corrosion and the methods adopted to prevent them, dwelling especially on the value of good oil, to which paint owes all its virtues, for the purpose of preservation. Colours, however, would always be used, and hence the necessity of using such as would not spoil the oil. Oxide of iron, which is made in this town, was the article most generally employed for painting iron structures, and a detailed account of its manufacture was given. As tar was frequently used for painting iron, the danger attending its employment in a crude form was made clear by the fact that on some bolts which had been immersed in water contaminated with tar residues.—The Chairman (Mr. T. Berridge), in opening the discussion, remarked on the value of experience as against experiment.

It was in this way that benefit was derived from listening to the papers. He had used oxide of iron paint for woodwork, and found it to answer very well. Lead paint was objectionable where iron gases were present, as it went black. Zinc white formed a substitute in such cases.—Mr. T. Jordan, in proposing a vote of thanks, said he saw no objection to the use of oxide of iron for painting wood. The great point was to see that the oil was pure. In many cases where the paint was condemned it was really the oil that was at fault.—Mr. Peet said he was pleased to hear the vote of thanks proposed by Mr. Jordan. He would like to know whether the scale so injurious to steel and iron plates as they come from the mill could be readily scraped off.—Mr. G. Hyde said the simple immersion in oil of plates for structural purposes was a great advantage in that the examination of the finished work could be effected.—Mr. W. J. Stevens asked whether there was any advantage in treating steel during its manufacture to prevent rust and on when used for boiler construction.—Mr. Carulla, in the course of his reply, said that every effort was made to get the scale away from the plates whilst they were being rolled. It was not an easy matter to get rid of it if once rolled in. Mr. Stevens had put a very interesting question. A case was recorded in which some steel plates were used in an Austrian railway company to be laid below the rails and found to rust with extreme rapidity. An analysis of this steel showed that it contained 1.08 per cent. of sulphur. This was an amount that the steel maker tried to keep out, and for boiler plates his object was to make it as pure as possible.—The proceedings then terminated.

## THE PLYMOUTH GAS WORKS NUISANCE.

At the Royal Hotel, Plymouth, last week, Mr. E. Ridley, Q.C., one of the official referees of the High Court of Justice, sat to decide damages in an action brought by W. O. Ward, proprietor of the Plymouth, Cosside, against the Plymouth and Stonehouse Gas Company. Mr. W. Graham, barrister-at-law (instructed by Wilson and Loye), appeared for Mr. Ward; and Mr. Channel, Q.C., and Mr. H. E. Berridge, barrister-at-law (instructed by Shelly and Johns), for the Gas Company. It was alleged that since October, 1894, the company had neglected to take reasonable precautions to prevent noxious smoke and gas, coal and iron dust, and other injurious matter escaping from the works, spreading and distributing themselves, and settling over the plaintiff's lands and buildings. It was alleged that the nuisance arose when the retorts were working, or the company were using coal or coke, especially when the wind was blowing from a particular quarter, and that the retorts were charged by a process which created an unnecessarily large amount of dust and smoke, which the plaintiffs had not taken measures to consume. After a brief opening by the referee and counsel adjourned to Cosside, and minutely inspected the tannery.

On re-opening the court, Mr. Ward stated that his was a very old established business, which his father acquired in 1865. It was then located in another part of the town, the present site being occupied by the works, which stood on 2½ acres of land, were capable of producing 400 hides a week. When he started there in 1887, and up to 1894, he had nothing to complain of in regard to the Gas Company's works. In 1894 the company erected a new retort house, within a few days of its being worked the nuisance complained of

began. He frequently called the attention of the officers of the company to the great damage he was sustaining. The directors and other persons visited the works frequently.

The Referee: Do you admit the company did their best to mitigate the nuisance? Since the injunction they have, but not previously. The nuisance was greater last winter than during the present one. Witness, in the course of further evidence, said it was essential that the skins should be kept clean. The smoke and coal dust did not interfere much with the liming process, but when the skins were in the tannery, and when taken out of the pits great damage was done. Additional work was entailed by the nuisance. Very frequently work had to be entirely suspended in consequence of the immense quantity of smuts which fell. The discolouration of the leather by the smoke had greatly deteriorated its value. All his present stock was more or less damaged, and he had left the amount of loss to expert witnesses. Had the "liquor" now in the pits not been damaged he should have estimated its value at £3,000. If the nuisance continued it would be impossible for him to carry on the business. Samples of the polluted liquor were handed in, and also dust, &c., taken from the polluting tanks.

On the resumption of the hearing on the Friday, Dr. A. Wynter Blythe, the Medical Officer of Health and Public Analyst for Marylebone, gave evidence as to the result of his examination of dust which had collected in the leather loft of the plaintiff's tannery, and in the tan liquors. In each case he found a considerable proportion of iron, coke, and mineral matter prejudicial to the quality of the leather. In the dust taken from the floor of the loft, there was 9 per cent. of iron; and in that gathered from the butts of leather there was 4 per cent.

Plaintiff was recalled, and was cross-examined at length by Mr. Channell as to the financial transactions of his business and his comparative expenditure on wages, hides, and tannery materials for several years past. He was also cross-examined as to the increased labour involved in the tannery operations owing to the deposition of soot and dust from the gas-works, and the additional cost thereby entailed.

Mr. H. R. Procter, Professor of Chemistry (in the leather industries section) at the Yorkshire College, Leeds, gave further evidence as to the presence of iron and other mineral substances in the dust and tan liquor obtained from plaintiff's works; and he submitted solutions of tanning liquor, showing the deleterious effect of a very small quantity of iron in darkening the tint, and so damaging the colour of the leather.

On the hearing of the case being resumed the following morning, a consultation took place, which ended in the company consenting to a verdict for the plaintiff for £3,500.

## Trade Notes.

**LOW RAILWAY RATES FOR FERTILIZERS.**—It is intimated that specially low rates are either already in operation or can be obtained on application between stations on the Midland Railway for the conveyance of agricultural produce, feeding stuffs, manures, &c., when forwarded in bulk. Applications should be made to either the agents in charge of the company's goods stations or to headquarters.

**SEA-WATER FOR LONDON.**—A conference of delegates from the principal local authorities interested in the London Sea-water Supply Bill, was held last week at St. Martin's Town Hall, Charing Cross. Major Probyn, chairman of the St. Martin's Vestry, presided, and representatives were present from the vestries of Hackney, St. George's, Clerkenwell, St. Luke's, Battersea, Paddington, Bethnal Green, Hammer-smith, Camberwell, Westminster, and St. Pancras, and the Strand Board of Works. A number of amendments to the Bill, drafted for the purpose of safeguarding the interests of the ratepayers and the local authorities, were considered and agreed to, and the conference adjourned.

**AN INTERESTING DYEING CASE.**—At the Salford County Court, on Tuesday, before his Honour Judge Parry, Messrs. Frenkian and Co., of Dickinson street, claimed from Messrs. Mark Fletcher and Sons, dyers, Brindle Heath Works, Pendleton, £11. 9s. 2d., the value of 40 bundles of yarn, which, it was alleged, the defendants had rendered unmarketable by their negligence. Mr. G. Rideal appeared for the plaintiffs, and the defendants were represented by Mr. R. Smith. The case for the plaintiffs was that 40 bundles of yarn were delivered by them to the defendants to be dyed red. When samples of the dyed yarn were sent home it was found that the yarn was not perfectly red, but was flaked with white spots, and therefore unmarketable. It was stated that the yarn was intended to be sent to Roumania, and there made into ladies' bathing costumes. On behalf of the defendants, expert evidence was called to show that the yarn was of such a hard quality that it was impossible for it to be dyed red without the appearance of white spots. Judgment was given for the defendants, with costs.

THE BYE-PRODUCTS OF THE MANCHESTER GASWORKS.—A communication has been received from the Local Government Board acceding to the application of the Corporation for power to borrow a sum of £25,000. for the erection of plant for the manufacture of the residual products of the gasworks. As soon as Parliament has confirmed the approval thus given a beginning will be made with the erection of plant for the manufacture of sulphate of ammonia. The application of the Corporation for power to borrow money for this purpose was, it may be remembered, the subject of an inquiry which extended over several days, the proposal being strongly opposed by a number of chemical manufacturers, including Hardman and Holden, Limited, who have hitherto purchased the bulk of the ammoniacal liquor and other bye-products of the gasworks.

## Market Reports.

### TAR AND AMMONIA PRODUCTS.

Benzols are dull at 2s. for 90's, and 1s. 8d. for 50/90's. Carbolic acids are about the same, 60% crude being quoted 2s. 1d., and 40% crystals 7¼d. There is no change in naphthas, the respective prices for crude and solvent still being 8d and 1s. 3d. Anthracene stands at 10½d. for 30% A, and 9d. for B. Pitch quiet at 32s. 6d. to 33s., f.o.b. East Coast.

There is a decided improvement in sulphate of ammonia, and prices are firmer at all ports. Beckton is quoted £8. 5s. (paid), London outside makes £8. 2s. 6d. to £8. 5s., Liverpool and Hull £8. to £8. 1s. 3d., and Leith £8. 1s. 3d. to £8. 2s. 6d., all prompt.

### LIVERPOOL MINERAL MARKET.

The briskness reported last week has not only continued but increased. Manganese arrivals: There is only one arrival this week, which has gone direct into consumption, whilst stocks are entirely exhausted, and prices are considerably advanced, both for prompt and forward delivery. Ground manganese is stronger, and prices are firmer, in consequence of the raw material being done at higher prices; the ground is now being done at £6., £8., £10., and £15. per ton, according to quality. Manganiferous iron ore continues to arrive slowly, and prices are firm at last quotations. Chrome ore: Arrivals have continued to somewhat increase, but prices are at present unaltered. Bauxite continues in good request, and sells freely at 20s. for firsts, 16s. for seconds, and 12s. for thirds, f.o.b. French chalk is unusually brisk, especially for the higher grades, which are of limited quantity—"Angel White" qualities sell freely at 65s to 70s, 80s. to 90s., and 100s to 110s. per ton, according to grade. Wolfram and scheelite: The market is cleared, and prices are firmer, with little ore to be sold at present. Ferrotungsten and ferro-chromium are unchanged. Arsenic: Prices have somewhat receded, business having been done at £23. 10s. to £25. per ton, according to quantity. Fuller's earth remains steady at 50s. for lump, 55s. for ground, and 75s. per ton for impalpable powder, "Emerald," and other brands. Ochres and umbers continue in fair demand at 40s. per ton for prime umber, and 60s. to 65s. per ton for J.C. ochre. Antifricition ore is quiet at unchanged prices. Pumice-stone is in more request, prime lump being done at £7. 10s. per ton for Teneriffe, and Italian at £10. 10s., with ground at £6. Kieselguhr is in steady demand at unchanged prices. Asbestos and mica are inquired for, and a fair business is done at prices as last quoted. Bog ore is quiet at 22s. 6d. per ton. Magnesite sells slowly. Plumbago continues to meet with a brisk demand, foundry and lubricating qualities being done at £6. to £10. 10s. per ton, according to grade, with prime Ceylon at £15. to £20. per ton. Carbonate and sulphate of barytes are quiet, with no change to report. Molybdenite is in somewhat better demand, cerite, euxenite, orthite, etc., being only quiet.

### MISCELLANEOUS CHEMICAL MARKET.

There are no important changes in the position of any of the main products of the alkali trade. Values remain tolerably steady all round. For bleaching powder export trade is fairly brisk, but home trade is quiet, price, £6. 17s. 6d. to £7. per ton, at makers' works. Chlorate of potash unchanged, at 4¾d. Chlorate of soda, 6d. to 6¼d. Ammonia alkali, 58% without change, at £3. 7s. 6d. per ton, bags, makers' works. Leblanc soda ash, casks, 1d. per deg., f.o.r. Soda crystals, bags, 35s. per ton. Caustic soda rather quiet, and spot quotations are: for 77%, f.o.b. Liverpool, £9. 7s. 6d. per ton; 74%, £8. 7s. 6d.; 70%, £7. 7s. 6d. per ton; 60%, £6. 7s. 6d. Recovered sulphur in good demand, at £3. 12s. 6d. per ton, f.o.r. Sulphate of copper has again advanced to £18. per ton, f.o.b. Saltcake selling freely, at 22s. 6d. to 23s. 6d. per ton, f.o.r. Price of brown acetate of lime is rather lower, at £4. 2s. 6d., c.i.f. Grey acetate of lime rather

firmer. Acetates of lead and soda and acetic acid without change in values. Arsenic still in fair demand, at £22. to £22. 10s. per ton, but some small re-sales made at rather easier rates. For potash, caustic and carbonate, demand continues good, and prices are firm. Ammonia salts and ammonia in generally good request, and prices steady. Yellow prussiate of potash quiet, at 7¼d. Sulphocyanides without change. On the whole trade is reported quiet from the principal centres of the chemical trade.

### LIVERPOOL OIL AND COLOUR MARKET.

WEDNESDAY.

OILS.—Palm oil is steady. The offerings on spot are limited, and sales of Lagos have been made at £18. 15s. and £18. 10s. for May-June delivery. Olive keeps firm, and the better qualities are inclined to improve in values. Holders of linseed are firm, especially for Liverpool makes, at 19s. 9d. to 21s. per cwt. in export casks. Cottonseed is steady, but rather quiet, Liverpool refined being quoted 17s. to 17s. 6d. per cwt. Castor oil is quiet, and all grades are rather dull. Prices are largely nominal, good seconds Calcutta being quoted 2¼d. to 2½d., and first pressure French 2½d. per lb. Tallow is quiet, and shows little signs of an improvement either in demand or prices. Resin is monotonously regular, there being a fair business doing in common and medium at full rates. Spirits of turpentine are very firm, at 22s. 6d. for prompt, there being a difficulty of obtaining adequate supplies even at this price. Petroleum steady: American 6¼d. to 7½d., and Russian refined 5¾d. per gallon.

COLOURS.—Prices are steady, and practically without change. Ochres: Oxfordshire, common, £10., medium, £12., best, £15. Derbyshire, common, 40s.; medium, 50s., best, 60s.; Welsh, best, 90s., seconds, 50s., and common, 18s.; Irish, Devonshire, 40s. to 45s.; French, J.C., 65s. Umber: 40s. to 45s. White lead, £16. Red lead unchanged. Venetian red, £6. to £10. Cobalt: Prepared oxide, 9s. 9d.; black, 9s.; blue, 6s. Oxide of iron: Common, £7.; medium, £10.; finest, £20. Zinc oxide, £22. 10s. to £25.

### REPORT ON MANURE MATERIAL.

There has been no important feature in the market to notice, the business done being on a moderate scale at about last week's prices.

Sales have been made of 75/80% Florida phosphate rock, for summer shipment, at 6¼d. per unit to the Baltic. To the North Sea 6d. per unit would probably be accepted, and a fraction less in cargoes, c.i.f. to good U.K. ports. South Carolina River rock offers at 5½d. c.i.f. good U.K. ports, but this price is rather above the ideas of buyers, who are in no hurry to cover further their next season's requirements.

There is nothing to report in River Plate bones, prices required for summer and autumn shipment precluding business. Bombay bone meal, on spot, offers at £3. 16s. 3d. per ton, and for shipment at £3. 13s. 9d. Crushed Kurrachee bones offer for shipment at £4 per ton, Liverpool or Hull, but do not find buyers.

Nitrate of soda is steady at 7s. 10½d. per cwt. for ordinary quality, and at 8s. for refined. Due cargoes are worth about 7s. 10½d. per cwt.

Home-prepared dried blood is quoted 7s. 6d. per unit, f.o.r. at works, but 7s. 3d. would likely do for good lines.

### THE METAL MARKETS.

LONDON, WEDNESDAY.—Pig iron, firmer: Scotch warrants closed at 46s. 5½d.; Middlesbrough, 38s. 1d. cash, and hematite, 48s. 0½d. Copper, steady: Chili bars, G. O. B.'s and G. M. B.'s, closed at £45. 5s. to £45. 10s. cash, and £45. 11s. 3d. to £45. 16s. 3d. three months. Tin, firm: Straits closed at £59. 15s. to £60. 5s. cash, and £60. 7s. 6d. to £60. 17s. 6d. three months; Australian, £61. 5s. English ingots, £63. 10s. to £64. Lead, steady: Spanish, £11. 1s. 3d.; English, £11. 2s. 6d. to £11. 5s.; Silesian spelter, ordinary, £16. 7s. 6d. Nickel, 1s. 2½d. Antimony, £30. 10 to £30. 10s. Quicksilver, dull: first hands, £6. 15s.; second hands, £6. 14s. Copper shares, steady: Cape, 2½ to 2½; Copiapo, 2 to 2¼; Libiola, 2½ to 2½; Mason and Barry, 3½ to 3½; Rio Tinto, 20½ to 20½; Tharsis, 5½ to 5½.

GLASGOW, WEDNESDAY.—Market quiet and steady. Scotch done at 46s. 6d., 46s. 5d., and 46s. 6d. cash, also at 46s. 7d. and 46s. 8d. one month; closing with buyers at 46s. 5½d. cash; sellers ask 46s. 6d. Cleveland closes with buyers at 38s. 1d. cash, sellers ask 38s. 2d. Cumberland hematite done at 48s. 3d., 48s. 4d., and 48s. 3½d. one month; closing with buyers at 48s. 0½d. cash, sellers ask 48s. 1½d. Middlesbrough hematite closes with buyers at 45s. 6d. cash, sellers ask 45s. 7½d.

## TYNE CHEMICAL REPORT.

TUESDAY.

chemical market is still quiet, though there is perhaps a slight in the demand, and shipments continue fairly good. Prices altered. Soda crystals, £2. 2s. 6d. per ton, gross weight, locally, £3. 17s. 6d. per ton. Caustic, 76/77%, £9. 5s.; 70%, £7. 10s. 15s. per ton.

Whiting powder, softs, £7. 5s. per ton, nett; hards, £7. 10s. per ton, caustic soda, 76/77%, £9. 5s. per ton, nett; do., 70%, £7. 15s. nett; recovered sulphur, 2 cwt. bags, £3. 17s. 6d. per ton, nett; sh., 48%, £4. per ton, nett; do., 52%, £4. 3s. 4d. per ton; do., 56%, £4. 6s. 8d. per ton, nett; alkali, 36%, £2. 15s. nett; white alkali, 48%, £4. 10s. per ton, nett; do., 50%, per ton, nett; do., 52%, £5. per ton, nett; hyposulphite of 7 cwt. casks, £6. 5s. per ton, nett; do., 1 cwt. kegs, £7. nett; silicate of soda, 75° Tw., £2. 12s. 6d. per ton, nett; 80° Tw., £3. per ton, nett; do., 140° Tw., £3. 7s. 6d. per ton, nett; soda crystals, casks, £2. 2s. 6d. per ton, nett; do., 2 cwt. bags, £2. 2s. 6d. per ton, nett weight; of potash, 5d. per lb., less 6%; pearl hardening, per ton, nett; pure white sulphate of alumina, £3. 17s. 6d. nett; blanc fixe, £7. 5s. per ton, nett; chloride of barium, crystals, £6. 15s. per ton, nett; do., 90/95%, crude calcined, per ton, nett; sulphide of barium, crystals, £4. 15s. per ton, nett; of alumina, £30. per ton, nett; aluminate of soda, £30. nett.

South Durham salt is stronger, at 9s. per ton, f.o.b. Tees, increased exports.

LS.—The market generally is unaltered. There is a fair for best steam, and price is steady, at 8s. 3d. to 8s. 6d. per ton, or household coals the demand is falling off, and prices easier. firm, and export shipments increasing. To-day's prices are:—Northumbrian steam, 8s. 3d. to 8s. 6d. per ton; second qualities, to 7s. 6d. per ton; small steam 3s. 6d. to 3s. 9d. per ton; gas 6d. to 6s. 9d. per ton; coke, firm, 15s. to 15s. 6d. per ton.

## WEST OF SCOTLAND CHEMICALS.

GLASGOW, TUESDAY.

It appears to have been a weakening in the general market the past week, but prices are not appreciably affected. The spring shipment business proceeds, but is not in very volume. There has been some talk of giving a better tone to the market by curtailing the production. The Scotch dye and printing works are all very well employed, but the dyers in that dye chemicals are only in limited demand because of sent tendency to light shades chiefly for fabrics. There has welcome variation in sulphate of ammonia within the past few it has been heading upwards, and to-day Leith prompt figure is mineral oils and paraffins are unchanged, except in the case of oil, which is fractionally easier to English and Irish buyers. Use of this is the less firm position of the American petroleum

prices current are:—Soda crystals, £2. 2s. 6d., nett, Tyne; do., 48/56°, £3. 15s. to £4. 15s. nett, Tyne; white alkali, £4. 10s. to £5. nett, Tyne; alum in lump, £5. to £5. 5s. nett; caustic soda, white, 74° £8. 7s. 6d., 70/72° £7. 7s. 6d., 60/62° 6d., and cream 60/62° £6. 7s. 6d., all nett, Liverpool; bleaching £7. nett, Tyne; saltcake, 23s.; borax, English, £20., and boracic acid, £30. nett, Glasgow; bicarbonate of cwt. casks, £6. 10s., and 1-cwt. casks £6. 15s. nett, Liverpool; ate of potash, 4½d. nett, for Scotch and English deliveries (for 4½d. nett, f.o.b. Glasgow); bichromate of soda, 3¼d. nett, for and English deliveries (for export, 3½d. nett, f.o.b. Glasgow); of potash, 5d. less 5%, Liverpool; nitrate of soda, 8s to ; sulphate of ammonia, £8. prompt, f.o.b. Leith; oniac, first and second white, £39. and £37. nett, any port; of copper, £17. 15s. less 5%, Liverpool; paraffin urd, 1½d. and soft, 1½d. to 1½d. per lb.; paraffin wax, 120° ined, 2¾d. to 2¾d. per lb.; paraffin spirit (naphtha), 7d. per paraffin oil (burning) No. 1, 6½d., and crystal, 6¼d., at works, ch buyers (English sales about ¾d. lower); ditto (lubricating) 5., 88° £5. 10s. to £6., and 890/895° £6. to £6. 10s. imports of sugar at Greenock were 52,970 bags cane unrefined 18 bags beet unrefined.

## LL PAINT, OIL, AND COLOUR REPORT.

TUESDAY.

—The demand is well maintained, and markets are more yet prices were not sufficiently low last week to have touched om, for refined cotton oil experienced another fall of about 5s. r, the tone all round is better, and it is a unanimous opinion

that they cannot fall lower. The imports of linseed during the week have been 19,528 quarters, viz.: From River Plate, 12,609 quarters; Bombay, 4,304 quarters; Riga, 2,350 quarters; and Nicolaieff, 250 quarters. Linseed oil, after declining to 17s. 4½d., naked, spot, turned firmer again, closing quiet at last week's quotation of 17s. 7½d.; May-August, 18s. 1½d. to 18s. 3d.; and September-December, 18s. 3d. to 18s. 4½d.; boiled and refined from £1. to £2. per ton extra. Exports or the week, 1,760 cwt. During the week the imports of cottonseed has been 1,761 tons from Alexandria. Refined cotton oil, about 5s. per ton easier, closing at 14s. 9d., naked, spot or month; May-August, 15s. 3d.; casks £1 and ordinary barrels 30s. per ton extra. Export of refined for the week has been 9,520 cwt. Tallow dull, a parcel offering at 18s. Spirits of turpentine firmer. Olive oil anything from £26, ex quay, upwards. Castor oil firm, 2½d. per lb for first pressure. Boiled siccativ oil, £12. per ton. Brown Yorkshire grease, £8. per ton. American cottonseed oil soap, 70% fatty acids, £11. per ton in barrels.

CAKES.—A poor demand for all kinds. Linseed cakes, 95% pure, £5. 17s. 6d. to £6. per ton; Americans, £5. Russians, £5. 12s. 6d.; Oil cakes, £5. Cotton cakes, best makes, £3. 17s. 6d.; seconds, £3. 12s. 6d. to £3. 15s. Rape cakes: East India, £3. 10s.; Black Sea, £2. 10s.

PAINTS.—Makers continue exceptionally busy. Foreign white lead is offered at 16s. 6d. in 5 to 10 ton lots, and English is dearer. Red lead firmer. Oxide of zinc unchanged; dry mineral colours are unaltered; oxide of iron, venetian red, yellow ochre, black, blue, green, &c., ground in oil, from £11. per ton. Ready-mixed paints are strongly competed for, £24. in lever tins; paint remover, £1. 5s. to £1. 10s. per cwt.; imperial black varnish, £5. 10s. per ton in barrels; oak varnish from 5s. 6d. per gallon.

## New Companies.

**Blatchford and Co., Limited.**—CAPITAL £5,000., in shares of £1. each. This company has been formed to manufacture, sell, and deal in paints, varnishes, colours, enamels, japans, red and white leads, etc.

**Matthews's Kentish White Lead Co., Ltd.**—CAPITAL, £35,000., in £1 shares. This company has been formed to carry on the business of lead smelters, desilverisers, chemists, drysalts, &c. The subscribers to the memorandum of association are:—W. Armitage, 29, Lower Belgrave-street, S.W., lieutenant-colonel; L. Bake, 7, Coburg-place, W., gentleman; R. Bedford, "Marston," South Ealing, W., gentleman; A. S. Francis, 2, Berkeley-street, Piccadilly, solicitor; P. Lofts, Oakmere, Potter's Bar, Herts, solicitor; W. S. Griffin, Raby House, Leyland-road, Lee, gentleman; T. J. Kensley, 108, Gaisford-road, Kentish Town, gentleman.

**Red Lion Chalk and Whiting Co., Limited.**—CAPITAL £50,000, in £1 shares. This company has been formed to acquire works and quarries at Northfleet, Kent, and to enter into an agreement between H. J. W. Bartlett and J. W. Barclay. The subscribers to the memorandum of agreement are:—C. J. Smith, Madeira Villas, Woodford, solicitor; J. Dadin, 34, Westlands-road, Clapham, veterinary surgeon; A. Scott, 10, Billingsgate Buildings, E.C., merchant; W. R. Jones, 19, Victoria-road, Norwood, merchant; J. J. Marsh, 4, Cleveland-place, S.W., physician; F. W. Serles, 16, Mark-lane, E.C., bootmaker; F. Champion, 133, Fenchurch-street, E.C., chemist.

**North British Chemical Syndicate, Limited.**—CAPITAL £30,000, in £1 shares, of which 10,000 are preference and 20,000 ordinary. This company has been formed to carry on the business of chemical apparatus manufacturers, chemical manufacturers, etc. Registered office is 45, West Nile-street, Glasgow. The subscribers to the memorandum of association are:—A. M. Shaw, 166, St. Vincent-street, Glasgow, C.A.; D. L. Doran, 12, Windsor-terrace, Kelvinside, Glasgow, clerk; A. S. Brown, Milverton, Lenzie, near Glasgow, clerk; J. M. Jack, 36, Dalhousie-street, Glasgow; A. Lonie, 45, West Nile-street, Glasgow, clerk; D. Dunn, 20, Park Circus, Glasgow, clerk; G. James, 17, Aytoun-road, Pollokshields, Glasgow, clerk.

## Gazette Notices.

## PARTNERSHIP DISSOLVED.

W. HIGHFIELD JONES, W. HALL JONES, and B. H. JONES, enamellers, etc., Wolverhampton and London, under the style of Jones Bros. & Co. and the Enamel Sign Co.

## BANKRUPTCY ACTS, 1883 and 1890.

## Adjudication.

SPAULL, T. H., and SCHLENGEMAN, E. (trading as Meyer, Spaul, and Schlengeman), St. Mary Axe, E.C., chemical merchants.

## TENDER.

### MANCHESTER CORPORATION GAS WORKS.

#### AMMONIACAL LIQUOR.

Gas Committee of the Corporation of Manchester are prepared to receive Tenders for the Purchase and Removal of the Ammoniacal Liquor to be produced at the Gaythorn, Rochdale-road, and Bradford-works during a period of one or more years, commencing at noon on the 1st June, 1896.

The Committee do not bind themselves to accept the highest or any Tender.

Tenders, addressed to the Chairman of the Gas Committee, and endorsed "Ammoniacal Liquor," must be delivered at the offices of the Gas Department, Town Hall, on or before Wednesday, the 10th of June, 1896.

Tender and further particulars may be obtained on application in writing to Mr. CHARLES NICKSON, Superintendent of the Department. A deposit of (which will be returned on receipt of the Tender) must accompany each for a Tender form.

By order of the Gas Committee,

WM. HENRY TALBOT,

11, Manchester, 7th May, 1896.

Town Clerk.

## TENDER.

### MANCHESTER CORPORATION GAS WORKS.

#### SPENT OXIDE.

Gas Committee of the Corporation of Manchester are prepared to receive Tenders for the Purchase and Removal of the Spent Oxide to be produced at their Gaythorn, Rochdale-road, and Bradford-works during a period of one, two, or three years, from the 30th June next. The Committee do not bind themselves to accept the highest or any Tender.

Tenders, addressed to the Chairman of the Gas Committee, and endorsed "Spent Oxide," must be delivered at the offices of the Gas Department, Town Hall, not later than 10 a.m. on Wednesday, the 10th June next.

Tender and further particulars may be obtained on application in writing to Mr. CHARLES NICKSON, Superintendent of the Gas Department.

By order of the Gas Committee,

WM. HENRY TALBOT,

11, Manchester, 7th May, 1896.

Town Clerk.

## ADVERTISEMENTS.

**STABLE** Glue, Senegalin, and Vegetaline, for Linen, Jute, and Woollen. Advertiser, with thorough knowledge of the nature of these Vegetable Glues wishes to enter into partnership. Very undertaking.—Apply "F," *Chemical Trade Journal* Office, Manchester.

**NIUM** or Materials containing Selenium, also Nickel and Cobalt Wanted. State particulars, and address letters to AND WILHELMY, Chemical Works, Gorlitz, Germany.

## POINTS IN THE PETROLEUM CONTROVERSY.

THE evidence that is being given before the Committee inquiring into the present state of the mineral oil industry is getting very interesting. Last week it was especially so, as no less a person than Mr. B. Redwood himself gave his testimony. If ever there was any doubt as to the necessity of inquiring into the laws, his evidence has laid it for ever. He explained at some length what petroleum was, and brought out the fact that the trade meaning and the legal meaning of the word petroleum were two different things. Is it not high time, therefore, that our legislators once more looked carefully into the working of the law? It is surely so merely that this anomaly shall be righted. At the same time it is desirable that a further careful inquiry be made, so that in the future the public may be able to get petroleum, and not have to buy naphtha at the price of petroleum. Through this strange difference in the definition of petroleum, we have for years had adulterated oil foisted on us, with the additional drawback that this adulterated product has proved itself much more dangerous than genuine petroleum, as the fire brigade statistics so clearly show.

In the foregoing and subsequent remarks we use the word petroleum in the sense usually accepted in this country, viz., a generic title for all burning oils, whether Russian or American (kerosene), except Scotch shale oil, which is rightly designated paraffin. At the same time it must be noted that since paraffin was used in this country long before American petroleum, it is a common practice for the general press to speak of all burning oil as paraffin, and, consequently, almost all lamp accidents are spoken of as being due to paraffin, when they are almost without exception due to the use of American oil. This error is of course a very convenient one for the Anglo-American Oil Company, *alias* the Standard Oil Company, *alias* the Oil Trust, *alias* the South Improvement Company (different and nominally extinct names for one and the same instrumentality that is supplying us daily with semi-naphtha as petroleum) and they will be very sorry for any committee of inquiry to dispel the confusion that exists in the mind of the public on this point. Having made this clear we are in a position to fully appreciate Mr. Redwood's evidence.

Murder will out, and so will the truth sometimes. Mr. Schweitzer, of New York, has publicly declared that the American refiners take naphtha, pure and simple, and mix it with the heavy oil that comes next to lubricating oil, and is scarcely distinguishable from the same. By so doing an oil having the same flash-point and specific gravity as genuine petroleum is prepared. This has long been known to those scientific gentlemen who have not wilfully closed their eyes to all that may not be beneficial to the Anglo-American Oil Company. We now have had it made public by experimental data and statements from the Netherlands, France,

and the United States, and it is a most unfortunate oversight that Mr. Redwood, as consulting adviser to the Corporation of the city of London—the municipal representative and guardian of the people of London—should have allowed such a glaring imposition on the good faith of the public and fraudulent attack upon their pockets to have passed unchallenged and unnamed. He states his belief that the simple exclusion of the dangerous lamps made abroad would do much to put an end to lamp explosions. Does this mean explosions, or accidents? The latter, we presume, as Mr. Redwood thinks that real explosions seldom, if ever, occur, and so cannot want preventing. Further, this witness says experience has shown that explosions may occur with oil of more than 100°F. flashpoint. This experience is doubtless culled from the two good old "chestnuts," Lord Romiley's and the "Goliath" accidents, with perhaps one other case, which we will refrain from mentioning out of respect to the recorder of the incident.

Be it noted that excluding foreign lamps of indifferent make will only "do much" to prevent accidents. How much? We assert with conviction that such a precaution would not prevent in six months as many accidents as have occurred with 100°F. flashpoint oil in six years, which may be safely stated at half-a-dozen.

Again, with regard to the exclusion of bad German lamps, why should not bad American oil be excluded at the same time. Wherefore should the profitable sale of cheap (and nasty) lamps be forbidden wholly and solely in order that the Rockefeller *coterie* and their satellites may profit by the unrestricted sale of their dangerous and dear-at-the-price lubricating oil. The lamps, though objectionable, can do little damage, unless they contain bad oil to start with. First chop down the tree and then lop off the branches. Do not climb ladders to do the latter in the belief that the tree will never again throw a shade.

But, to go further; if, as the witness suggested, the exclusion of the lamps is toned down to inspection at the port of entry, why not inspect the oil, too? Here we come to it. Instead of the "simple exclusion of the lamp," exclude neither lamp nor oil; but, simpler far, inspect them both. Send back the really defective lamps and take in the naphtha as naphtha and the petroleum as petroleum. Make the legal standard the same as the trade. Either define the percentage of naphtha that petroleum is to contain or take the existing written testimony of experts and class only as petroleum the product distilling from crude oil between 150° and 300°C. For convenience sake, check the percentage of naphtha by the Abel flash-point, though we have shown that this will not prevent completely the substitution of prepared oils. It will, however, prevent the loss of 300 out of the 365 lives a year that are lost by the use of the present "stuff" that the Government practically sanctions as safe for use as burning oil. That is the spirit of all we want, or the public safety demands, and you can put the whole summing up of the question on both sides in two nutshell. This is all we want, and this is all the Anglo-American Oil Co., *alias* &c., &c., do not want.

An attempt is now being made to divert attention to the wick as well as the lamp. If anything, we incline to the opinion that after the oil the wick and the lamp come in order of danger, owing to the quality of the former and the varying gauge of the wick tubes in the latter. But both difficulties can easily be remedied by honest co-operation between the makers, a thing which is impossible in attempting to prevent the sale of naphtha as petroleum.

At the same time the wick must not be lost sight of, as to part the wick played in prejudicing the public, and so becotting Russian petroleum when first introduced into the country, because it was as good as American oil but cheap is, perhaps, just one other point the American oil companies do not want dealt with too minutely in public.

Yet weigh the rival claims; the exigencies that operate and against, and more carefully still scrutinise the motives that actuate the claimants, and then explain how it can be that England of all countries, the spontaneous testimony of the interested and honest-minded is received with sidelong glances of suspicion because it is contrary to the dictates of a millionaires, whose weapons are well known to be perjury and dollar-tainted witnesses.

### ALUMINIUM TAPS AND COCKS.

THERE have been many materials employed, and still is suggested, for the manufacture of cocks suitable for use in chemical works and those industries in which acid and corrosive fluids have to be controlled.

Hitherto most of the improvements have been confined to valve large cocks, such as are principally employed in chemical works or for purposes where extra strong tackle is necessary to withstand rough usage. The field for a cock applicable to the brewing, wine and similar trades has up to the present been practically a virgin one.

This fact has been taken advantage of by Messrs. Bennett, Sons, Shears, of 167, Kingsland-road, London, who have recently introduced

the cock illustrated in the accompanying woodcut. It is made to the lines set forth in Deaville's patent, and has been designed specifically to meet the requirements of the chemical and kindred trades.

The barrel is made of aluminium, and is fitted with a vulcanised rubber packing. This combination ensures a long life, as the wear and tear is very small. The special advantage is that while standing well a lengthy trial with various chemicals, these taps have been found to stand the action of vinegar and similar weak acids in a most satisfactory fashion. The use of aluminium presents a great advantage over the numerous well-known alloys that are now extensively used for withstanding acids, as it is of such a poisonous nature as lead, and so especially suitable for dealing with dietetic substances.

## Legal Intelligence.

### SUPREME COURT OF JUDICATURE.

#### COURT OF APPEAL.

(Before Lord Justices Esher, Smith, and Rigby.)

DEAKIN v. THE SALT UNION, LIMITED.

The litigation involved in this suit has been before the courts for some considerable time, and at one time reached the House of Lords, who sent the case back to Mr. Ridley, the official referee, for assessment of damages. The action was for breach of agreement, and Mr. Ridley found that the plaintiff was only entitled to nominal damages instead of the £50,000. claimed, and it was against this finding that the present appeal was brought. The Divisional Court, by whom the appeal was heard in the first instance, upheld Mr. Ridley's decision, but also held in regard to certain contracts made by the plaintiff prior to February, 1889, he was entitled to other than nominal damages, and against this decision both plaintiff and defendants now appealed. In delivering the judgment of himself and Lord Esher, Lord Justice Smith said that the real question for decision was whether, on the facts before Mr. Ridley, the plaintiff was entitled to £50,000, or only nominal damages. The history of the case was as follows:—In 1888 the Salt Union was formed for the purpose of obtaining a monopoly of the sale of salt and to keep up its market price. The whole of the salt works in the Cheshire district were bought, including the plaintiff's, who was paid £225,000. An agreement was then made whereby the plaintiff was appointed one of the Union's salt distributors, or dealers, and it was agreed that the price charged to the plaintiff should not be higher than the lowest price charged by the Union to any other distributors or persons. It was agreed that the plaintiff should not sell to the public at less than the list price quoted by the Union, and there was to be allowed to the plaintiff a discount of  $2\frac{1}{2}$  per cent. on all sales. It appeared, however, that some time after this agreement the Union, while quoting a price of 7s. 6d. per ton to the defendants and the 23 other distributors, entered into a contract with the Runcorn Soap and Alkali Company for the supply of salt at 5s. per ton, and the plaintiff sought to establish his claim to indemnity by saying that during this time the Salt Union had been selling plaintiff's salt at 7s. 6d. instead of 5s., and that the number of tons he had bought from the Union multiplied by the difference of 2s. 6d. worked out to a sum of £50,000, which he was entitled to recover either as damages or as money had and received. On the part of the Union it was urged that the plaintiff could not prove that he had sustained any actual damage by reason of this breach of contract, and that it was clear on plaintiff's own evidence that he had actually suffered only nominal damages. The Union said that the price of salt as authorised by them was really the market price, which at once became known to the trade, and that no distributor could possibly get a higher price from his customers. His Lordship said he must agree with the contention of the Union that only nominal damages had been sustained. The plaintiff's manager had admitted in evidence that the distributors never got any profit on the salt other than the  $2\frac{1}{2}$  per cent. discount allowed by the Union, and he asserted that the customers got to know the Union's prices in every case, and that the distributors could not possibly get any more. Upon this evidence how could it be proved, even if the defendants had sold their salt to the plaintiff at 5s. per ton, that the plaintiff could have received more than 5s. per ton from his customers. In his lordship's opinion the evidence was conclusive that he could not have done so, and, therefore, on the evidence of his own witnesses the damage was only nominal. It was further to be observed that if the plaintiff purchased and sold salt at 7s. 6d. per ton, and only received as profit the  $2\frac{1}{2}$  per cent. discount, they would actually receive more profit than if they purchased and sold the salt at 5s. per ton. For similar reasons his lordship held that the decision of the Divisional Court in favour of the plaintiff on the point of existing contracts for chemical salt must be overruled. It had been clearly shown that plaintiff had not been one farthing out of pocket by the transaction, and the result would be (Lord Esher concurring) that the appeal of the plaintiff would be dismissed, and the appeal of the defendants allowed with costs.

Lord Justice Rigby dissented. In the course of a long and elaborate judgment, his lordship said that he considered it a very useless contention to urge that plaintiff had received  $2\frac{1}{4}$ d. per ton discount and profit by being charged the higher price of 7s. 6d. per ton instead of only 1½d. per ton profit, which he would have made had he been charged only 5s. per ton. It was, in his opinion, quite unnecessary to depart from the actual facts of this case for the purpose of embarking on an inquiry of a highly speculative nature. To establish the Salt Union's position it would have to be assumed not only that the union would fix the price to the distributors at 5s., but that the Union would, or could, have prevented the plaintiff from selling it at more than 5s., and there is absolutely no evidence that this was so. He agreed with Lords Esher and Smith in the matter of the Salt Union's appeal, but dis-

agreed with them in the matter of the plaintiff's appeal, which he thought should also be allowed.

Application for a stay of execution was refused.

### HIGH COURT OF JUSTICE. CHANCERY DIVISION.

(Before Mr. Justice Stirling.)

Mr. Terrell, Q.C., moved in the case of the Lancashire Explosives Company, Limited, v. the Roburite Explosives Company, Limited, for an order to commit Sir John Stokes and other gentlemen to prison for contempt of court. The learned counsel submitted evidence on oath to the effect that the defendants had been selling large quantities of their roburite, No. 3 explosive, in infringement of the plaintiffs' patent. He also put in the evidence of Professor Dewar, and the judgment of the Court of Appeal in the recent action in support of the motion. Mr. Cripps, Q.C., submitted on very high authorities that there was no infringement, that the two explosives were different in character and appearance, and that there was no justification for the order asked for. He asked that leave should be given to cross-examine the witnesses on the evidence tendered, which after some demur was agreed to by Mr. Justice Stirling. It was understood that such cross-examination should be proceeded with immediately, the motion to stand meanwhile.

### MERSEY AND IRWELL JOINT COMMITTEE.

A MEETING of this committee was held on Monday at the offices, Mosley-street. Sir J. T. Hibbert presided. Mr. T. W. Killick moved the adoption of the report of the chief inspector, which contained the following passage with regard to the Manchester Corporation—"Since the last adjournment thirty acres of land have been brought into operation as a filtration area, but the amount of sewage which is dealt with at present by this area is only about two million gallons per day, out of a total dry weather flow of fourteen million gallons, the remainder being treated by precipitation only. The question as to what further filtration works are to be adopted is now under consideration. Practically the whole of the sewage will be connected up towards the end of the summer of this year." Mr. Killick also moved the adoption of the report of the Consulting Sub-committee. The Committee reported that the following letter had been received from the Town Clerk of Manchester—"29th April, 1896. Dear sir,—Referring to my letter, handed you this morning, I am instructed to ask that the Mersey and Irwell Committee will be good enough to grant the Corporation of Manchester a short further extension of time to enable them to consider Sir Henry Roscoe's report, and the further measures to be adopted by them." Mr. Killick said that after considering this letter and the position of the Corporation, the sub-committee recommended that a further extension of time for two months be granted them to determine whether or not they will adopt the scheme for the filtration of the sewage which had been laid before them, or what further measures would be adopted by them, and that, in the meantime, the Corporation be requested to report to the Joint Committee at the earliest date what steps they are prepared to take. He added that the committee expected that at the termination of the period stated the Manchester City Council would come to the committee with a complete scheme for the proper filtration of all their sewage. The recommendation was adopted. The Committee also presented a report with regard to the works at Mossley, Hyde, Royton, Aspull, and Glossop. In each case an extension of time was granted. The consideration of the position of the Bury Rural Council was adjourned until next month.

A report from Sir Henry Roscoe on the condition of the effluents in various districts was received and adopted. Sir Henry Roscoe, who attended the meeting, said that the effluents were in many cases unsatisfactory, but it was to be remembered that manufacturers had many difficulties to deal with. He pointed out that chemical precipitation would not answer alone, but that they must also have some land or artificial filtration.—Mr. Alderman Jenkins (Salford) said that if land filtration was needed as well as precipitation, Salford could never meet the requirements of the committee, for the reason that they would never be able to get sufficient land.—Sir H. Roscoe said he did not mean that land filtration, and that only, must be used as well as precipitation, but some means of artificial intermittent filtration was necessary besides precipitation, if they were to have a good effluent.—Mr. Alderman Noton (Oldham) said that a short time ago he went on the Irwell where it ran into the canal, and he found that it was not now the foul smelling stream that it had been.—The Chairman said that Mr. Noton's remarks were very satisfactory. It was to be remembered that the work of cleansing the rivers could not be carried out without cost, but it was a work in which the outlay was thoroughly well expended, and he hoped it would be continued. (Hear, hear.)—Mr. Alderman Hopkinson remarked that the other day he was on the canal, and found that fish came up it as far as Latchford.—Sir H. Roscoe's report was adopted. Afterwards, several manufacturers attended before the committee with regard to works deemed necessary to prevent river pollution.

## A NEW LANCASHIRE INDUSTRY.

## MAKING SILK FROM WOOD PULP.

It will shortly be started in Lancashire a new and novel industry. It will be nothing less than the manufacture of silk out of wood pulp. Quixotic as the idea seems, it has already been established, or, rather, artificial silk, can be so made; that it can be used for many purposes for which natural silk is used, and others, and that it is especially suitable for working up with natural wool, or wool, for dress material, ribands, trimmings, church vestments, &c.; that the artificial silk can scarcely be distinguished from that for which we have hitherto depended on the natural silk; and that it can be sold at prices very much lower, and still yield a substantial profit. Dress and other fabrics made from this artificial silk are, indeed, already being sold extensively in London as leading features of this season's Paris novelties; though the artificial silk is so close to that of the ordinary silks, and so little different from the new discovery, that neither the ladies who have purchased, nor, indeed, the shopkeepers who have sold them have noticed the change that has been brought about in the process of manufacture.

Now the wood-silk comes from France, large works having been established at Besançon under patents granted to Count Hilaire d'Artois, Chevalier of the Legion of Honour, who discovered the process. The first established in 1893 the fact that it might be made into a successful industry. Since then the demand for the new commodity has surpassed the existing powers of manufacture; and some of the idea was mooted of adding to the number of our own works by arranging to make the artificial silk in England as well. It seemed to be especially desirable in the interests of Lancashire commercial prosperity has been seriously threatened of it was pointed out that Lancashire weavers are much more than the French in working up those textile combinations for artificial silk is particularly, though not exclusively, adapted. A meeting of silk and cotton manufacturers met to discuss the question, and sent out to Besançon a deputation consisting of some of the most prominent of the county, an engineer, a chemist, and a lawyer, to investigate the matter thoroughly. This was done, and the outlook was found to be promising that certain concessions have been secured, and a company in process of formation, and, to begin with, a factory, at a cost of £30,000, is to be built near to Manchester for the manufacture of artificial silk yarn from wood pulp, for sale to weavers, and to be worked up by means of their existing machinery. Inasmuch as the Lancashire firms have already arranged to take the total output of the factory, even before a single brick has been laid, and as others are to be put down plant of their own to be worked on the same principle, there is evidently good reason for the expectation that Lancashire will be the eve of some important expansions in her textile trades. The prospects are the more satisfactory because the concessions have been secured specially stipulate that Continental manufacturers of artificial silk are not to send their yarn to the British market while the international patent laws will, now that the rights in Britain have been bought up, secure that henceforth neither the goods manufactured therefrom shall be imported here, though the original idea comes from France, the industry, so far as the country is concerned, will be essentially British, and will be so without fear of competition on our own shores. At the present time our imports of articles manufactured from silk are so extensive that they amounted to £15,237,000, and those of raw silk to £1,883,000, or a total of £17,120,000; but now that our national ingenuity has shown that the silkworm can be supplanted by the tree, there is thought to be a good prospect of getting a good deal of this money among our own workers instead of sending it abroad.

The process in which wood pulp can be converted into silk yarn will be described by a brief account of the process as it is already at work in Lancashire. A certain economy of labour is practised by obtaining the wood pulp in its "paper" or "cardboard" condition (though wood may also be used), and the first operation is to nitrate the wood pulp by macerating it in a solution of nitric and sulphuric acid. The acids are squeezed out by a hydraulic press, and the stuff is then washed with water in large vats. It is then partially dried and placed for some hours in a revolving cylinder containing alcohol and ether. After this it is passed through a filter, leaving looking very much like thick gum, and is put in a vat from which it is forced by pneumatic pressure into pipes leading to the spinning department. Here the machinery looks like ordinary Lancashire spinning sheds, except that one of the spindles runs along each set of machines. These pipes are fitted with small taps, fixed close together, and each tap is connected with a tube, about a 1/4 inch in diameter, at the extreme point of which is an aperture so minute that no less than ten of the filaments of human hair would be required to make up the thickness of a

human hair. These glass tubes are known as "glass silkworms," and some 12,000 of them are in use in the factory.

The effect of the pneumatic pressure in the cylinders referred to above is to force the liquid matter not only along the iron tubes, but also, when the small taps are turned on, through each of the glass silkworms, where it appears there as a scarcely perceptible globule. This a girl touches with her thumb, to which it adheres, and she draws out an almost invisible filament which she passes through the guides and on to the bobbin. Then, one by one, she takes eight, ten, or twelve other such filaments, according to the thickness of the thread to be made, and passes them through the same guides and on to the same bobbin. This done, she presses them together with her thumb and forefinger, at a certain point between the glass silkworms and the guides. Not only do they adhere, but thenceforward the filaments will continue to meet and adhere at that point, however long the machinery may be kept running. In this way the whole frame will soon be set at work, the threads not breaking until the bobbin is full, when they break automatically, while they are all of a uniform thickness. The remaining processes are the same as in the case of ordinary silk, except in two respects. In the first place, the artificial silk has to be denitrified, so as to render it non-inflammable after the chemical processes it has undergone; and, in the next place, the hanks are placed on two revolving rollers which stretch and also "iron" them, producing that high degree of lustre which is one of the chief characteristics of the artificial silk. The new product is said to take dye much more readily than the natural silk, and certainly the colours and the extreme richness of some specimens that have been on view in London seemed to leave nothing to be desired in this respect. The chief difference in appearance between the natural and the artificial silk is in the greater lustre of the latter; though it will be found also that if a single thread of each is taken the artificial will "break" differently from the natural, and has only about 80 per cent. of its strength.

The success already secured by the new process in France is such that the introduction of the industry into Lancashire is expected to produce something like a revolution in the conditions of trade there, not only by bringing into existence a new occupation, but also by finding more work for a good deal of the weaving machinery that is now only partially employed; while the wearing of "silk," or what only experts will be able to distinguish from silk, will be rendered possible in the case of a vast number of people to whom the product of the silkworm is more or less a prohibitive luxury. All the same, there will probably be some sentimental regret that the silkworm itself, which has played so important a part in the clothing of the peoples of the Western world since the middle of the sixth century, should thus run the danger of being supplanted by liquefied timber; though the discovery that clothing can be made out of wood pulp is, after all, no more remarkable than that which was made by the Persian missionaries who visited China thirteen hundred years ago, and learnt to their surprise that garments could be made from the cocoons of a caterpillar.

**PETROLEUM FATALITIES.**—Mrs. Benton, an elderly lady, living in St. Margaret's-road, Lowestoft, was burnt to death last week through the upsetting of a petroleum lamp. She retired to rest as usual, leaving the lamp burning by the bedside. A lodger was awakened by a smell of smoke coming from Mrs. Benton's room. He broke open the door, and saw the bed blazing. With assistance the flames were extinguished, and the body of Mrs. Benton, fearfully charred and almost unrecognisable, was found.—Professor Geffcken died on the evening of the 1st inst. at Munich. A petroleum lamp exploded in his room, and the eminent scholar and jurist was suffocated, apparently in his sleep, during the fire that resulted. Professor Geffcken was born at Hamburg on December 9, 1830, and studied history and law at Bonn and Göttingen.

**INTERESTING TO COLLIERY OWNERS.**—The Manchester City justices had before them on Friday, last week, a case of considerable interest under the Public Health Act. Mr. Thomas Livesey, trading as the Bradford Colliery Company, Forge-lane, Bradford, was summoned to show cause why an order should not be made to abate a nuisance caused by black smoke from a chimney on his premises. On the 8th April an observation was taken of the defendant's chimney, and it was found that in the course of half an hour there were five minutes of dense black smoke. Mr. G. Rook, who appeared in support of the application for the order, referred to a case in which it was decided by Mr. Justice Hawkins that a colliery was not exempt under the Health Act unless the suppression of the nuisance would interfere with the efficient working of the colliery. Mr. Cobbett, who represented the defendant, said that the black smoke complained of was due to extra firing, which was rendered necessary owing to the breakdown of one of the boilers on the premises. He contended that the engine power available for working the colliery provided an ample margin in case of accident, and he thought that under the circumstances of the case an order for abatement should not be made. The Bench granted the order.

## Reports of Companies.

### THE OAKBANK OIL CO., LTD.

The eleventh annual meeting of this company will be held at 200, Buchanan-street, Glasgow, on Wednesday, 13th inst., at 12 o'clock noon. In their report the directors state:—The amount at the credit of profit and loss account, including the sum of £2,089. 19s. 6d. brought forward from last year, is £10,768. 18s. 8d., which the directors recommend should be disposed of as follows:—£3,375 in payment of a dividend (free of income tax) at the rate of 5 per cent. on the paid up capital of the company; £5,000. to defray cost of renewals, &c.; £1,000. to be added to the works insurance reserve fund, and £1,393. 18s. 8d. balance to be carried forward. It has been customary formerly to pay the dividend in two portions, but the directors recommend that it be paid in full on 28th May, 1896, on this occasion.

A contract has been entered into for the supply to this company for a period of years of the whole of the crude oil made by the Dalmeny Oil Company, Limited. In order to render the refinery adequate to deal with the increased quantity of crude oil, the directors acquired the right, on favourable terms, to adopt the "Henderson" system of continuous distillation, and are now applying that system throughout. The cost of doing this and other necessary renewals and reconstructions in connection therewith is estimated to amount to £5,000., of which sum £3,454. 6s. 8d. has already been expended.

In continuance of the policy inaugurated in 1894 the directors have added the sum of £1,221. 7s. 8d. to retorts renewal fund.

A disastrous fire occurred on 29th July last at the pit, which destroyed the pithead frame and scaffoldings, totally wrecked the shaft, and set the underground workings on fire. The underground fire was extinguished, the shaft repaired, and the pithead frame and scaffoldings restored as quickly as possible, but the full effects of the disaster were not overcome till the end of September. In the meantime the retorts were kept in full work with shale from Bing and purchased from other companies. The directors express their indebtedness to the kindly assistance rendered at the time by the Pumpherstone Oil Company, Limited. In addition to the sum recovered from the insurance companies, and the sum of £356. 15s. 8d. charged to works insurance fund, the loss, in consequence, was at least £2,500.

While there has been a considerable increase in the value of the liquid products of the company, the value of the solid products suffered a heavy fall, and the average price realised for the company's products generally is lower as compared with previous years. Yet the better refining facilities and the greater quantity refined have enabled the costs to be reduced to such an extent as to more than compensate for the lower values.

Combinations were entered into at the beginning of the year for the better regulation of the sale of the oil companies' products—one between the Scotch and American producers, relating to solid paraffin, fell through, and is not likely to be renewed; and one between the Scotch producers only relating to burning oils, was maintained with satisfactory results, and its renewal is now the subject of negotiation.

The directors regard the result of the year's working with satisfaction. The outlook for the next year is uncertain. With low costs, however, and prudent co-operation among the oil companies, a dividend may be earned.

The stocks on hand and in process have, as usual, been valued at the minimum prices.

### MASON AND BARRY, LTD.

The annual general meeting of this company will be held on Monday, 11th inst., at the Terminus Hotel, Cannon-street, at 2 p.m. The report of the directors states:—

The total quantity of ore broken and raised at the mine during the year 1895 was 185,463 tons, as against 196,922 tons in 1894, and the shipments during the same period (inclusive of ore from the Cementation Works) amounted to 186,368 tons, as against 242,386 tons in the previous year. The quantity of ore sold and invoiced for its sulphur value during 1895 amounted to 189,448 tons, as against 233,729 tons in 1894.

The average price of G. M. copper (including Chili bars) during 1895 was £42. 16s., as against £40. 4s. 6d. in 1894, £43. 16s. in 1893, and £45. 14s. in 1892.

After writing off in the Mine Books for depreciation of works, plant, etc., the sum of £15,018., and allowing for the variation in the estimated value of the stocks on hand in this country, on the continent, and in Portugal on the 31st December, 1895, and after deducting management expenses and Income Tax, the nett profits on working account have amounted to the sum of £16,155. 13s. to which has to be added the sum of £8,177. 7s. 5d. received as dividend on La Sabina shares, and the sum of £3,587. 6s. 8d. from sundries, making together a total profit for the year of £27,920. 7s. 1d.

The stocks of ore and copper precipitate broken, raised, and on hand, 31st December, 1895 (exclusive of the stocks at the Wallsend Works), are valued at £292,971. Compared with the two previous years, the figures stand as follows:—

|                                                                                                    | 1893.    | 1894.    | 1895.    |
|----------------------------------------------------------------------------------------------------|----------|----------|----------|
| Estimated value of stocks in England (exclusive of stocks at Wallsend Works, and on the Continent, | £28,391  | £51,849  | £46,117  |
| Estimated value of stocks in Portugal:                                                             |          |          |          |
| Balance of cost of ore at Cementation Works .. ..                                                  | 312,250  | 254,637  | 209,316  |
| Ore ready for shipment .. ..                                                                       | 6,564    | 13,407   | 18,848   |
| Copper precipitate .. ..                                                                           | 39,265   | 27,450   | 18,690   |
|                                                                                                    | £386,470 | £347,343 | £292,971 |

The stocks at the Wallsend Works are shown by the balance sheet as valued at £1,466. on the 31st December last, as against £3,691. on 31st December, 1894.

The mine assets in Portugal (after writing off for depreciation) stood at 31st December, 1895, at £456,907. These assets embrace the following items, and compare with the preceding two years as under:—

|                                                       | 1893.    | 1894.    | 1895.    |
|-------------------------------------------------------|----------|----------|----------|
| Works, buildings, land, plant, &c.                    | £103,926 | £94,942  | £84,843  |
| Railways, shipping piers, tug boats, &c. .. ..        | 73,838   | 74,691   | 72,082   |
|                                                       | 177,764  | 169,633  | 156,925  |
| Mine stores and cash assets .. ..                     | 53,381   | 50,148   | 53,128   |
| Stocks of ore and copper precipitate (as above) .. .. | 358,079  | 295,494  | 246,854  |
|                                                       | £589,224 | £515,275 | £456,907 |

As shown by the profit and loss account, the profit realised on the year's working amounts to £27,920. 7s. 1d., to which has to be added the balance, £3,651. 5s., brought forward from the year 1894, making together the sum of £31,571. 12s. 1d., less sundries, £346. 8s., and the directors having written the sum of £4,500. off La Sabina shares, there remains a balance for appropriation of £26,725. 4s. 1d. From this balance the directors recommend the payment of a dividend of 2s. 6d. per share, and to carry forward the sum of £3,578. 14s. 1d. to the next account.

The Company's claim against the assets of La Société Industrielle et Commerciale des Métaux is still undecided by the French Court.

In accordance with the company's articles of association, Mr. F. T. Barry, M.P., and Mr. H. E. Beddington will now retire from the Board, but, being eligible, they offer themselves for re-election, and the directors recommend that they be returned to the Board. The auditors are likewise subject to re-appointment.

As notified by advertisement, the general meeting will be followed by an extraordinary general meeting called for the purpose of considering, and if approved, passing, the following resolution:—"That the capital of the company be reduced from £840,000., divided into 210,000 shares of £4. each, to £630,000, divided into 210,000 shares of £3. each, and that such reduction be effected by returning to the holders of the shares that have been issued, and to the parties entitled to have fully paid shares issued to them, paid up capital to the extent of one pound per share, and by reducing the nominal amount of all the shares from four pounds to three pounds."

### THE BORAX COMPANY LTD.

The ordinary general meeting of shareholders of the Borax Company, Limited, was held on Friday 1st inst. at Winchester House, Old Broad-street, E.C., the Hon. H. A. Lawrence presiding.—In moving the adoption of the report, the Chairman stated that although the profits earned during the year showed a sensible increase as compared with the previous year, the directors regretted to say that they were far from being satisfactory. Competition had grown to such an extent, notwithstanding the low prices ruling, that the directors could not hold out any hopes of an immediate improvement in the company's position. Further important economies had been effected in the cost of production of the ore and the manufactured products of the ore, and all possible means were being employed to increase the outlet for the company's goods. The directors believed that if they could further increase the trade they would still further decrease the cost of production. The question of increasing the sales had received the careful attention of his colleagues and himself, and they had just organised a scheme for making their articles better known.—Sir W. G. Hunter seconded the motion which was carried.

## DIVIDENDS.

*er-Partington Paper Pulp Co., Ltd.*—At the last meeting of the it was decided to pay an interim dividend for the half year arch 31st of 4 per cent. (8 per cent. per annum), free of income

*ool Nitrate Co., Ltd.*—The directors have declared a dividend cent., payable May 15th. Transfer books closed until that date.

*Dynamite Trust Co., Ltd.*—The directors recommend a of 13 per cent.

## Trade Notes.

**TE STATISTICS.**—The Permanent Nitrate Committee's public l circular for May states:—"Nitrate of soda: Total exports to April, 400,000 quintals; loading for Europe, May 1, 1,146,000 ; imports, Europe, April, 70,120 tons; deliveries, Europe, 15,150 tons. Visible supply, Europe, May 1: Stocks and 11,870 tons."

**SION IN A COAL BUNKER.**—A fatal accident occurred at ntly on board the Duke of Leuchtenberg's yacht *Sarnitz*, lying in the harbour. Five of the crew opened the coal and descended with a lighted lamp. An explosion immediately . One of the crew, named Brukassoff, was enveloped in d severely burnt. He was at once taken to the hospital, and rtly after his admission. Another man, named Kadrine, who seriously burnt, and a third, who was only slightly injured, ended to on board the yacht. The two other men escaped

**SHIPMENTS TO THE EAST INDIES.**—Messrs. Thomas Higgin in their monthly circular, report regarding the shipments of e East Indies that the clearances from Liverpool for Calcutta, try to 30th April, were 42,434 tons, the total from other ports 1,943—a total of 55,377 tons. This compares with the clear- m Liverpool for the same period in 1895 of 51,503 tons. The s from Liverpool for other ports, 1st January to 30th April, 90 tons. The probable clearances during May make a total 9 tons.

**TE SHIPMENTS.**—The Permanent Nitrate Committee has the following official telegram from Iquique:—"20,300,000 remain for export to all parts for the twelve months ending t next. Directorate cannot increase until prices pass 6s., in se will only increase the shipments according to requirements nption." In the terms of the nitrate combination agreement, ase of exports must be decided upon not later than the 30th of er.

**GASOLINE EXPLOSION.**—A fatal explosion of gasoline this week in the basement of a building in the heart of ti, U.S.A. The premises were wrecked, and six persons were d 18 injured. Many more, it is feared, are buried in the This playful product is refined from the naphtha that is so y introduced into the "export oil," concocted for the benefit h and other European consumers of "petroleum." Even in volatile form it has fully sustained its reputation for in- lity, though not in quite such a wholesale fashion.

**US FUEL.**—We notice that Messrs. W. F. Mason, Limited, of it, Manchester, are doing well with the Duff Patent Gas Pro- hich seems to be largely supplanting the older forms. They ave over 200 of the Duff Producers at work, and are getting mportant repeat orders from firms who have partially adopted m. Apart from the glass, steel, and pottery trades, they are welcome in many branches of the chemical trade. We are understand that the old Siemen's pattern can be readily con- the Duff system, the advantages of converting being quickly d by the increased yield of gas, and the complete obviation of ouble some task of clinkering, with its attendant waste of fuel nditure for labour.

**lary.**—One of the most familiar figures in the chemical tra- Manchester district has passed over to the majority in *Mr. Beck*, whose death took place at his residence, Ashton Old- enshaw, on the 28th ult., in his ninety-first year. Mr. Beck nally a wheelwright and smith at Openshaw, and it was his at he never slept a single night outside the borders of that . He stood "under the clock," as it is termed, in Fountai- over 30 years as a representative of Farmer's firm at Gorton, ut in an appearance up to four or five weeks ago. The funeral e at Ardwick Cemetery on Monday last, and was of a private .—*Colonel North*, of nitrate fame, died suddenly at a meeting gunas Nitrate Company, on Tuesday. The lamentable occur- used considerable excitement and subsequent depression in circles and in the City.

**"GASSING" FATALITY AT WIDNES.**—What might have been another very serious accident was partially averted this week at Pilkington's Works, Widnes. Two men, named John Isherwood and Charles Lynch, were working in the carbonating room when an escape of sulphuretted hydrogen occurred, and they were overcome. Richard Dutton, fireman, went to their assistance, and he also was overcome. Eventually the men were got into the fresh air. Artificial respiration was applied, and Dutton and Lynch were restored, but Isherwood died in about two hours. A steeplejack who was repairing the chimney at the same works also died this week from injuries sustained by the breaking of the rope which was supporting him at an elevation of about 90 feet.

**THE ADULTERATION OF BURNING OIL.**—According to the state- ment made by Mr. H. Schweitzer, of New York, some of the refiners of American petroleum have a way of adulterating their product. This consists in making up oil from a mixture of "tops and bottoms" —i.e., naphtha and the last boiling, or heavy oil. It is stated that these mixtures can be made to show the same flash-point and specific gravity as the best burning oils; and as the boiling point is also the same, only an exact fractional distillation would furnish means for detecting the adulteration. For this purpose, Mr. Schweitzer advises the use of the solidifying test generally, which also shows the amount of solid paraffins present in the oil. Upon this, Herr R. Kissling re- marks that he has used the solidifying tests daily for at least 20 years, not because of its supposed value as a test of the burning and illu- minating power of the oil, but because the separating out of the paraffins in cold weather might give rise to great inconvenience. For applying the test, Mr. Kissling makes use of an appliance consisting of a couple of concentric tin cylinders, containing a mixture of ice and salt. Into this, standing upon a cork plug, is inserted the oil in a glass tube which also contains a thermometer. According to Mr. Schweitzer, one of the large American railway companies demands that oil flashing at 150° to 175° shall remain clear when cooled and kept for 10 minutes at 1° Fahr.: and 300° oil must remain clear when cooled to 32° Fahr.

**SEA CARRIAGE OF PETROLEUM.**—For many years shipowners have declined to carry petroleum as cargo unless it has been guaranteed by the shippers as complying with the condition imposed by the Petroleum Acts—namely, that it would not give off an inflammable vapour at a temperature of less than 73° Fahrenheit. The inquiry proceeding by a Select Committee of the House of Commons has, however, suggested the necessity of some declaration making it clear that, when petroleum is about to be shipped as part of a general cargo, responsibility for compliance with this condition of the Acts of Parliament rests solely with the shipper. The committee of the London Direct Short Sea Traders' Association, under the presidency of Mr. R. Cattarns, have therefore formulated the following petroleum resolution clause, which will henceforth form part of their authorised Bill of lading for over-sea purposes, and also be inserted in the way bills used in the coasting trade:—"The shipowners refuse to carry petroleum which gives off an inflammable vapour at a temperature of less than 73° of Fahrenheit's thermometer. Shippers will be held to guarantee the petroleum they ship will not give off an inflammable vapour under any circumstances at a temperature of less than 73° of Fahrenheit's thermometer, and the consignees of the goods will be held responsible for all the consequences and legal penalties attaching under the Petroleum Act of Great Britain or elsewhere in the event of their shipping petroleum of a nature such as that above specified. Clause 12 of the authorised form of Con- tinentall Bill of lading shall apply to this shipment."

## Market Reports.

## TAR AND AMMONIA PRODUCTS.

Benzols are about the same, 90's being quoted 1s. 11d. to 2s. for prompt. July-December 1s 10d. For 50 90's the present quotation is 1s. 8d. There is no change in crude carbolic acid, 60% standing at 2s. 1d., but 40% crystals are a fraction lower at 7d. Crude naphtha and solvent are still quoted 8d. and 1s. 3d. respectively. Pitch is easy at 32s 6d., f.o.b. East Coast. Anthracene and creosote unaltered.

The spurt in sulphate of ammonia is not very well sustained. It has undoubtedly been a relief, but for prompt buyers can again only be induced to operate at a reduction. London outside makes £8. 2s. 6d., Liverpool £8. 2s. 6d., Hull £8, and Leith £8. 1s. 3d. to £8, forward. Beckton £8. 10s.

## MISCELLANEOUS CHEMICAL MARKET.

The market generally for alkalis is unchanged, and there is a fairly good demand for the staple products for export. Bleaching powder is offered at rather easier rates for the States, and £7. to £7. 2s. 6d. per ton is about the nearest spot quotation for hardwoods, f.o.b. Liverpool, and £6. 17s. 6d. f.o.r. makers' works. Caustic soda

is in fairly steady request, and prices are unchanged, viz., f.o.b. Liverpool, 77%, £9. 7s. 6d. per ton; 74%, £8. 7s. 6d.; 70%, £7. 7s. 6d. per ton; 60%, £6. 7s. 6d. nett., 10 ton lots and upwards. Ammonia alkali, 58%, £3. 7s. 6d. per ton, bags, f.o.r. Soda crystals 35s. per ton, bags. In chlorate of potash there is a fair business doing at 4½d.; soda slightly easier at 6½d. to 6¾d. Salteake firmer in price, and in better inquiry at 22s. 6d. per ton, f.o.r. Recovered sulphur £3. 12s. 6d. per ton. Sulphate of copper has further improved in price at £18. 15s. to £19. per ton, f.o.b., according to brand. Yellow prussiate of potash weak at 7¼d., London make 7d. per lb.; prussiate of soda 6½d. Potash, caustic and carbonate, continue in fairly good demand, and prices are strong—90/92% carbonate at £17., and caustic, 90%, £24. 10s. nett., c.i.f. White sugar of lead steady at £22., c.i.f.; brown £14. 15s., and grey £19. per ton. Acetate of lime—brown £4. 5s. per ton, but no business doing; grey £7. per ton. Acetate of soda in fair request at £14. 10s., c.i.f. Acetic acid unchanged in price, and in moderate demand. For white powdered arsenic there is still a strong inquiry, and prices firm at £22. to £22. 10s. Arseniates higher in price. Nitrate of soda steady at 7s. 10½d. to 8s. Ammonia salts, generally, firm. Sulphocyanides in good request, but no movement in price. For borax price is maintained by the syndicate at £19. 10s., crystals. Aniline oil and salt quiet, but no change in value. Green copperas in much better demand, and price firmer, owing to scarcity of supply. Reports do not indicate any general improvement as yet in the demand for chemicals.

### REPORT ON MANURE MATERIAL.

There has been no special feature in the market to comment upon. There continues to be a fair demand, but any change in prices is in favour of the buyers. Further business in 75/80% Florida rock is reported at 6¼d. to the Baltic, and to the North Sea at 6d. per unit, summer shipment. A fraction under 6d. per unit would do c.i.f. to good U.K. ports. The position of South Carolina rock is unchanged. There is nothing fresh in River Plate bones, sellers' and buyers' ideas of value for shipment being still rather widely divergent. Bombay bone meal for shipment offers at £3. 12s. 6d. per ton, and this price would no doubt be accepted for parcels near at hand. On spot, £3. 15s. per ton is asked. Nothing doing in crushed East Indian bones. Nitrate of soda remains steady at 7s. 10½d. per cwt. for ordinary quality, and 8s. for fine quality on spot. Due cargoes are worth about 7s. 10½d. per cwt., ordinary quality. Home-prepared dried blood is more inquired for, and 7s. 6d. per unit is again asked.

### LIVERPOOL MINERAL MARKET.

The mineral market still continues tolerably brisk. Manganese: There are no further arrivals to report; stocks being small, prices have still further advanced. Ground manganese: The demand is good, and prices show an improvement, £6. 10s., £8. 10s., £10. 10s., and £16. asking, according to grade. Manganiferous iron ore: There are no arrivals to report this week, but prices are firm at last quotations. Chrome recontinues in demand at current prices. Bauxite: The demand continues good at 20s. 9d. for firsts, 16s. for seconds, and 12s. for third quality, f.o.b. French chalk: All arrivals have gone into consumption, and for the better grades prices have advanced; "Angel White" qualities meet with a strong demand at 65s. to 70s., 80s. to 90s., and 100s. to 110s. per ton, according to grade. Wolfram and scheelite: There are no stocks, and prices are slightly advancing. Ferro-tungsten and ferro-chromium are in fair demand at unchanged prices. Arsenic: This article continues scarce; £22. 10s. to £25. per ton is asked, according to quantity. Fuller's earth remains steady at 50s. for lump, 55s. for ground, and 75s. per ton for impalpable powder, "Emerald," and other brands. Ochres and umbers: A steady business is done in these articles at 60s. to 65s. per ton for J.C. ochre, and 40s. to 45s. per ton for umber. Antifriction ore: There is no change to report, the demand being quiet at unchanged figures. Pumicestone is in quiet demand, prime Teneriffe lump being done at £7. 10s. per ton, and Italian at £10. 10s., with ground at £6. Kieselguhr continues in fair demand at unchanged prices. Asbestos and mica continue to be inquired for, and a quiet business is done at unchanged prices. Bog ore continues in quiet demand at 22s. 6d. per ton. Magnesite sells slowly. Plumbago: The demand continues good, especially for foundries' qualities, which are done at £6. to £10. per ton, according to grade, prime Ceylon being done at £15. to £20. per ton. Carbonate and sulphate of barytes continue quiet, without change. Fluorspar meets with a fair demand. Feldspar is quiet. Molybdenite is in fair demand, but cerite, euxenite, orthite, ytterite, etc., continue quiet.

### LIVERPOOL OIL AND COLOUR MARKET.

WEDNESDAY.

OILS.—Palm oil, though dull in tone, is moving fairly well, and spot sales of Lagos have been made at £18. 15s. to £18. 12s. 6d.,

while for forward May-August £18s. 10s. has been done. Olive is in good request, though prices are very firm, and have hardened for better qualities. Candia is offering at £31. 10s. per tun, Malaga at £30., and Seville at £29. 10s. Linseed is rather easier as compared with last week, but closes firm at 19s. 6d. to 20s. 6d. per cwt., for Liverpool makes, in export casks. Cottonseed has fallen in value, and is dull even at the decline: Liverpool refined is quoted 16s. 9d. to 17s. 3d. per cwt. Castor oil is without change for spot business, there being practically nothing else doing; good seconds Calcutta range from 23½d. to 24½d., and first pressure French 2¼d. to 2½d. per lb. There is nothing to report in tallow. With resin the demand continues satisfactory for lower grades, but for fine is very indifferent; there are no changes in values. Spirits of turpentine continue steady, the scarcity keeping the price firm at 22s. 6d. per cwt. Petroleum slow of sale, at 6¼d. to 7¼d. per gallon for American, and 5¾d. per gallon for Russian refined.

COLOURS.—Prices are steady, and practically without change. Ochres: Oxfordshire, common, £10., medium, £12., best, £15. Derbyshire, common, 40s.; medium, 50s.; best, 60s.; Welsh, best, 90s., seconds, 50s., and common, 18s.; Irish, Devonshire, 40s. to 45s.; French, J.C., 65s. Umber: 40s. to 45s. White lead, £16. Red lead unchanged. Venetian red, £6. to £10. Cobalt: Prepared oxide, 9s. 9d.; black, 9s.; blue, 6s. Oxide of iron: Common, £7.; medium, £10.; finest, £20. Zinc oxide, £22. 10s. to £25.

### THE METAL MARKETS.

LONDON, WEDNESDAY.—Pig iron, easy: Scotch warrants closed at 46s. 0½d.; Middlesbrough, 37s. 5½d. cash, and hematite, 46s. 4½d. Copper, steady: Chili bars, G. O. B.'s and G. M. B.'s, closed at £45. 8s. 9d. to £45. 13s. 9d. cash, and £45. 15s. to £46. three months. Tin, quiet: Straits closed at £59. 17s. 6d. to £60. 7s. 6d. cash, and £60. 10s. to £61. three months; Australian, £61. 5s. English ingots, £63. 10s. to £63. 15s. Lead: Spanish, £11. 1s. 3d. to £11. 2s. 6d.; English, £11. 15s.; Silesian spelter, ordinary, £16. 15s. Nickel, 1s. 2½d. Antimony, £30. 5s. to £30. 10s. Quicksilver, dull: first hands, £6. 15s.; second hands, £6. 13s. 6d. Copper shares, steady: Cape, 2½ to 2½; Copiapo, 2 to 2¼; Libiola, 2¼ to 3; Mason and Barry, 3½ to 3½; Rio Tinto, 20½ to 21½; Tharsis, 5½ to 5½.

GLASGOW, WEDNESDAY.—Market firmer, with small business. Scotch done at 46s. 0½d., 46s. 1d., and 46s. 0½d. cash, also at 46s. 2½d. one month; closing with buyers at 46s. 0½d. cash, sellers ask 46s. 1d. Cleveland done at 37s. 7d. one month; closing with buyers at 37s. 5½d. cash, sellers ask 37s. 6d. Cumberland hematite closes with buyers at 47s. 4½d. cash, sellers ask 47s. 6d. Middlesbrough hematite closes with buyers at 44s. 10½d. cash, sellers ask 45s.

### TYNE CHEMICAL REPORT.

TUESDAY.

Chemicals continue quiet, with little or no change in the volume of business doing. Soda crystals are quoted at £2. 2s. 6d. per ton, gross weight, locally. Sulphur, £3. 17s. 6d. per ton. Caustic, 76/77%, £9. 5s. per ton; 70%, £7. 10s. to £7. 15s. per ton. Other prices as under:—

Bleaching powder, softs, £7. 5s. per ton, nett; hard, £7. 10s. per ton, nett; caustic soda, 76/77%, £9. 5s. per ton, nett; do., 70%, £7. 15s. per ton, nett; recovered sulphur, 2 cwt. bags, £3. 17s. 6d. per ton, nett; soda ash, 48%, £4. per ton, nett; do., 50%, £4. 3s. 4d. per ton, nett; do., 52%, £4. 6s. 8d. per ton, nett; alkali, 36%, £2. 15s. per ton, nett; white alkali, 48%, £4. 10s. per ton, nett; do., 50%, £4. 15s. per ton, nett; do., 52%, £5. per ton, nett; hyposulphite of soda, 5-7 cwt. casks, £6. 5s. per ton, nett; do., 1 cwt. kegs, £7. per ton, nett; silicate of soda, 75° Tw., £2. 12s. 6d. per ton, nett; do., 100° Tw., £3. per ton, nett; do., 140° Tw., £3. 7s. 6d. per ton, nett; soda crystals, casks, £2. 2s. 6d. per ton, gross weight; do., 2 cwt. bags, £2. 2s. 6d. per ton, nett weight; chlorate of potash, 5d. per lb., less 6%; pearl hardening, £3. per ton, nett; pure white sulphate of alumina, £3. 17s. 6d. per ton, nett; blanc fixe, £7. 5s. per ton, nett; chloride of barium, refined crystals, £6. 15s., per ton, nett; do., 90/95%, crude calcined, £6. per ton, nett; sulphide of barium, crystals, £4. 15s. per ton, nett; carbonate of alumina, £30. per ton, nett; aluminate of soda, £30. per ton, nett.

SALT.—There is no change in South Durham salt, which is quoted at 9s. per ton, f.o.b. Tees. There is a good demand.

COALS.—There is practically no alteration to report in the market. Steam coals are in rather better demand. Coke continues in good request, with increased shipments. Best Northumbrian steam, 8s. 3d. to 8s. 6d. per ton; second qualities, 7s. 3d. to 7s. 6d. per ton; small steam 3s. 9d. to 4s. per ton; household coals, dull, 10s. per ton; gas coals, 6s. 6d. to 6s. 9d. per ton; coke, firm, 15s. to 15s. 6d. per ton.

## WEST OF SCOTLAND CHEMICALS.

GLASGOW, TUESDAY.

a number of the possible buyers of sulphate of ammonia are from purchases, as if the belief that the recovery is evanescent article has steadily mended, and at the close of the week 8. 5s. prompt, f.o.b. Leith, which is also the figure to-day, not much doing, however, and the views of Continental agents are in opposition to anything like a permanent recovery anytime. A lot was sold forward (July and August delivery), s. per ton, but makers generally look for more than that. Chemicals continue on a rather quiet market, with no changes.

The export traffic proceeds, but new business scarcely comes in a way to satisfy makers. The annual financial declarations of mineral oil companies have begun, and, so far, show better. At least two of the concerns, for the past year or two unprofitable, will be found this year with fair sums for division. To the good burning oil are due these improved results. It is hoped that prices will be capable of being maintained.

prices current are:—Soda crystals, £2. 2s. 6d., nett, Tyne; 48/56°, £3. 15s. to £4. 15s. nett, Tyne; white alkali, 4. 10s. to £5. nett, Tyne; alum in lump, £5. to £5. 5s. nett; caustic soda, white, 74° £8. 7s. 6d., 70/72° £7. 7s. 6d., 60/62° £1. and cream 60/62° £6. 7s. 6d., all nett, Liverpool; bleaching £7. nett, Tyne; saltcake, 23s.; borax, English, £20., and boracic acid, £30. nett, Glasgow; bicarbonate of soda, £6. 10s., and 1-cwt. casks £6. 15s. nett, Liverpool; potash, 4½d. nett, for Scotch and English deliveries (for ½d. nett, f.o.b. Glasgow); bichromate of soda, 3¾d. nett, for English deliveries (for export, 3½d. nett, f.o.b. Glasgow); potash, 5d. less 5%, Liverpool; nitrate of soda, 8s. to sulphate of ammonia, £8. 5s. prompt, f.o.b. Leith; niac, first and second white, £39. and £37. nett, any port; of copper, £18. less 5%, Liverpool; paraffin scale, hard, 1¾d., and soft, 1¾d. to 2d. per lb.; paraffin wax, 120° red, 2¾d. to 2½d. per lb.; paraffin spirit (naphtha), 7d. per gallon; paraffin oil (burning) No. 1, 6½d., and crystal, 6¾d., at works, for buyers (English sales ½d. to 1d. lower); ditto (lubricating) £5., 885° £5. 10s. to £6., and 890/895° £6. to £6. 10s. Exports of sugar at Greenock were nil.

## L. PAINT, OIL, AND COLOUR REPORT.

TUESDAY.

—The demand for oils is well maintained, and there is also a movement in price of linseed oil; and cotton oil, which has the easier, is again about the same prices. The stocks of seed oil, ending April 30th, were—Linseed, 3,064 quarters; against 12,237 ending March. Cottonseed, B., 173 tons; against 440 tons March. Cottonseed, W., 682 tons; against 699 tons ending March. The imports during the month have been—Linseed, 67,075 against March, 76,849 quarters. Rapeseed, 11,907 quarters; against March, 14,141 quarters. Cotton, 10,080 tons; against 11,620 tons. Oil on the spot has improved 5s. per ton, closing firm at 17s. naked; May-August and September-December, 18s. 4½d., boiled and refined, £1. to £2. per ton extra. Export for the month been 1,580 cwt. Refined cotton oil, after being easy, closes spot 14s. 7½d., naked; and May-August offering at 15s. 1½d. with 13s. 4½d., naked, spot; casks, £1. and ordinary barrels on extra. Export of refined, 6,800 cwt. Olive oil unrefined, Turpentine, 21s. 3d. per cwt. Castor oil, 2½d. per lb. for pure. Cod oils, £17. to £20. per ton. American cotton oil 6, fatty acids, £11. per ton in barrels. Margarine steady trade; kegs, 34s. to 35s. American lard in pails, demand slow, 27s. 6d. per cwt.

S.—In quiet demand. Linseed cakes, 95% pure, £5. 17s. per ton; Americans, £5. 2s. 6d. Russians, £5. 15s.; 5, £5. Cotton cakes, best makes, £3. 17s. 6d.; second 53. 12s. 6d. to £3. 15s. Rape cakes unchanged.

PAINTS.—The demand continues good and the situation unchanged. White and red leads unchanged; oxide of iron, venetian red, yellow ochre, black, blue, green, &c., ground in oil, from £11. per ton. Ready-mixed paints, from £24 per ton, in 1, 2, 4, and 7lb. lever tins; paint remover, 25s. to 30s. per cwt.; imperial black varnish in good demand, £5. 10s. per ton in barrels; oak varnish from 5s. 6d. per gallon.

## New Companies.

"Wood Pulp," Ltd.—CAPITAL, £2,000, in shares of £10. each. This company has been formed to acquire the goodwill of the trade, paper known as "Wood Pulp."

Isaac Holden and Sons, Ltd.—CAPITAL, £517,200., in £100. shares. This company has been formed to acquire and take over as a going concern the business now carried on at Bradford, Yorkshire, by Messrs. Isaac Holden and Sons, of woolcombers, grease extractors, and soap manufacturers. The subscribers to the memorandum of association are:—I. Holden, Bart., Oakworth House, near Keighley; A. Holden, Bolton Percy, Yorkshire, woolcomber; E. Holden, Park-avenue, Southport, woolcomber; T. Craig, Alston Lodge, Bradford, woolcomber; E. I. Holden, Bolton Percy, Yorkshire, woolcomber; I. H. Holden, Park-avenue, Southport, woolcomber; J. H. Roper, Alston Lodge, Bradford, manager.

Pioneer Petroleum Syndicate, Ltd.—CAPITAL, £50,000., in £1. shares. This company has been formed to acquire and work oil wells, refineries, and mines, and to deal in and distribute petroleum and petroleum products. The subscribers to the memorandum of association are:—G. F. Adams, 18, Aubert Park, Highbury, clerk; T. B. Catchpool, 105, Hanley-road, Stroud Green, clerk; F. Vickers, 97, Dagnall Park, South Norwood, clerk; C. R. Smith, 19, Dayton Grove, Peckham, clerk; H. F. Adams, 10, Brook-road, Holloway, cashier; T. T. Curtis, 17, Beulah-road East, Thornton Heath, cashier; W. B. Woosnam, 23, Ada-road, Camberwell, clerk.

Thomas Younie and Co., Ltd.—CAPITAL, £20,000., in £1. shares. This company has been formed to acquire and carry on the oil, plant, and colour manufacturing business of T. Younie, of Newcastle-on-Tyne. The subscribers to the memorandum of association are:—T. Younie, 42, Grosvenor-road, Newcastle, manufacturer; E. M. Watson, 40, Fern-avenue, Jesmond, Newcastle, clerk; R. Young, College-street, Newcastle, secretary; J. Moffatt, Hetton-le-Hole, Durham, veterinary surgeon; A. Lee, Seaton Delaval Colliery, Northumberland, overman; F. G. Lundi, 31, Westgate-road, Newcastle, solicitor; F. Wright, 28, St. Edmund's-road, Gateshead, clerk.

Dufftown Auction Co., Ltd.—CAPITAL, £1,000., in £1. shares. This company has been formed to trade as salesmen and agents for agricultural produce, feeding stuffs, fertilizers, chemicals, implements, &c.

Scottish Cyanide Co., Ltd.—CAPITAL, £200,000. in £10. shares. This company has been formed to carry on the business of cyanide and ferrocyanide manufacturers and dealers, in the United Kingdom. The subscribers to the memorandum of association are:—J. B. Readman, 4, Lindsay-place, Edinburgh, analytical chemist; G. H. Gemmell, 4, Lindsay-place, Edinburgh, analytical chemist; C. M. King, 115, Wellington-place, Glasgow, merchant; T. Aitken, 5, Grosvenor Crescent, Edinburgh, shipowner; G. Readman, 10, Damanary-street, Edinburgh, advocate; W. A. Robertson, 48, West Nile-street, Glasgow, merchant; W. Sanderson, Talbot House, Leith, distiller; Wm. Blair, L.L.B., 28, Charlotte-square, Edinburgh.

## Gazette Notices.

## PARTNERSHIPS DISSOLVED.

M. ARCULUS, J. WARRY, and G. N. ARCULUS, glass manufacturers, Birmingham, under the style of Alfred Arculus and Co.

MESSRS. FOSTER, BLACKETT, and WILSON, LTD., of Newcastle-on-Tyne, are voluntarily winding up their company for the convenience of reconstruction.

MIST or Assistant Chemist.—Post Wanted by  
ng Man (24), A.R.C.S., in Laboratory; willing to go abroad. First-  
nces and qualifications; three years Royal College of Science, and three  
practical Analyst.—Address, "J," 42, King's-road, Reading.

## Notices.

Communications for the *Chemical Trade Journal* should be  
d, and Cheques and Post Office Orders made payable to—  
**VIS BROS., 32, Blackfriars Street, MANCHESTER.**

Our Registered Telegraphic Address is—  
"Expert, Manchester."

NATIONAL TELEPHONE 3060.

Terms of Subscription, commencing at any date, to the  
*Trade Journal*,—payable in advance,—including postage  
ut of the world, are as follows:—

arly (52 numbers) ..... 12s. 6d.  
lf-Yearly (26 numbers) ..... 6s. 6d.  
arterly (13 numbers) ..... 3s. 6d.

rs will oblige by making their remittances for subscriptions by  
Post Office Order, crossed and payable to "Davis Bros."

s, reports, and correspondence on all matters of interest to  
nical and allied industries, home and foreign, are solicited.  
ndents should condense their matter as much as possible,  
one side only of the paper, and in all cases give the names  
resses, not necessarily for publication. Sketches should be  
separate sheets.

## Advertisements.

Advertisements of Situations Vacant, Premises on Sale or To be Let  
eous Wants, and Specific Articles for Sale by Private Contract are  
the *Chemical Trade Journal* at the following rates:—

30 Words and under ..... 2s. 6d. per insertion  
Each additional 10 words ..... 6s. 6d.  
ements of Situations Wanted are inserted at one-half the  
ates when prepaid, viz.:—

30 Words and under ..... 1s. 6d. per inserti  
Each additional 10 words ..... 6s. 3d. "

isements intended or insertion in the current week's issue  
each the office by Thursday morning at the latest.

## CURRENT TOPICS.

THE EKMAN PULP AND PAPER COMPANY, LIMITED.

THIS week the well-known Ekman Paper Company have  
made an issue of £130,000. of 4½ per cent. First Mortgage  
Debentures of £100. each. These have been issued for the  
conversion or redemption of the outstanding debentures and  
debenture stock of the company, which amount to £112,500.,  
and also with the additional object of providing further  
working capital. The profit and loss account for the last five  
years has shown a steadily increasing balance on the right  
side. The company are not merely paper makers, but are  
also makers of wood-pulp by the sulphite process, which  
is carried on at their principal works at Northfleet,  
Kent. They also have a smaller paper-making works at  
Ilford. It is interesting to note that while the profit last year  
is shown by the profit and loss account to have been close on  
£23,000., the interest on the present issue of debentures calls  
for about one-fourth of this sum, or £6,000. Power has been  
reserved to further issue £20,000. of debentures, which shall  
rank with the present issue, but this can only be done for  
providing funds for expenditure on capital account, and with  
the consent of the trustees.

SEWAGE AND THE SHIP CANAL.

Despite all that has been said about the terrible results  
that were bound to attend the discharge of the Ship Canal  
water between Runcorn and Eastham, owing to the state of  
the Irwell, which is the main feeder of the upper reaches,  
and the sewage that is also turned directly into the Canal, it  
appears that very little difference has actually been caused by  
the change. Fish used to abound, and still do so. While the  
state of the Canal and its feeders has by no means wholly  
spoil the livelihood of those who follow the piscatorial  
calling, still it is necessary to bear in mind that there are  
evidences of sewage contamination, which is evidently dis-  
tasteful to both fish and vegetation. It has recently been  
placed on record that while mullet and pollock are caught in  
the locks at Eastham, and porpoise frequent the Cheshire  
side of the Mersey, none of these are now found on the  
Lancashire side. So that while animal and vegetable life  
is still flourishing in water which has undoubtedly received  
much sewage contamination, the results are only apparent  
on one side of the river. This sounds somewhat paradoxical,  
but perhaps may be accounted for by the assumption that,  
owing to the great dilution, the water has purified itself in the  
way peculiar to moving water, while the solids have deposited  
on the Lancashire bank, thus making this side objectionable.  
It is a pity the same results cannot be induced at Barton and  
higher up the Canal. It is stated that the Irwell is much  
better than it was, but as it is probable we shall have some-  
thing to say on this point in the near future, we will reserve  
our remarks until we can check impressions by figures.

## THE NEW PETROLEUM SCHEME.

Considerable excitement has been caused in certain quarters over the talk there has been about a scheme which is shortly to be brought before the public, proposing to import crude petroleum, and refine it in this country. The scheme certainly sounds a pleasing one, but it is not so easy to estimate the worth of the proposal. There are many difficulties that must be taken into careful consideration. Already the scheme and the draft prospectus have been severely handled, and apparently not without justification. At the same time this criticism only gives one side of the case. It must be admitted that so far the case against the scheme, as made out at present, is a strong one, and will need substantial refutation, but the whole affair is of importance for other than mere financial reasons. We shall come to these when we have briefly referred to the objections that have been raised against the scheme.

In the first place exception is taken to the value of the tank steamers that are to be acquired, and on this point the current criticism is so pertinent and formidable as to leave little room for the existence of two opinions. The principal point, however, would seem to be the prospective sources of the crude petroleum. After a moment's thought it will be seen that any idea of American crude must be dismissed. The Standard Oil Co. practically controls all that can get to the sea board, having for years strenuously opposed all the independent efforts that have been made to get crude to the coast, either for refining or export. Consequently there is nothing for it but to depend on Russian and Galician supplies. Concerning Galician crude, it finds at present an all-sufficient outlet in the immediate vicinity, and little could be depended on from this quarter. Of Russian there is plenty, but there is the loss and cost of the transit of crude as compared with refined, and the opposition of the Russian Government to the exportation of crude to be taken into consideration. Lastly, it is a fact that in those countries where the refining of imported crude oil is successfully prosecuted there is a strong protective tariff to check the import of refined oil. In this country there is no such tariff, while to conceive Protectionist ideas is a sin and to promulgate them a crime. Such are the chief points raised against the scheme.

In the present state of the oil industry, however, it is necessary to look a long way below the surface before arriving at a decision on the merits of an argument. Though there are weak points in this new scheme, before attaching great importance to any statements it is necessary to know the authors, both of the scheme and the criticisms thereon. It is well known that any proposal such as that set forth under this new scheme would be attacked by the all deadliest weapons of competition that the great American oil company possess. The idea would not suit their book at all, and therefore at all costs would have to be argued out of time, then bought out, sworn out, crushed out, burnt out, blown out, or otherwise rendered non-existent. Until we know the personality of those who are so eager to protect the public against investing their money in a worthless scheme, little value can be attached to their warnings, which are so glibly given before even the prospectus has been officially issued to the public. If the source of information is satisfactory, the early exposure of the weak points of the new scheme is a good fault, but though we are not greatly enamoured of the scheme as far as we have been able to acquaint ourselves with its details, still it is necessary to accept with caution wholesale condemnation that is not backed by the authority or respectability conferred by the large type of the leading article or the classification of the Correspondence column. When

such a sweeping indictment is accorded the stray corner which is more often sacrificed to a paragraph descriptive of someone's pills or syrup, it is as well to take a little salt with your literary repast, so as to temper the flavour.

## THE CARRIAGE OF EXPLOSIVES.

## AN IMPORTANT CASE.

AT the Thames Police-court, E.C., last week, the adjourned summonses against the New Explosives Company, Limited, of Queen Victoria-street, E.C., taken out by Mr. J. W. Godfrey, of the London County Council, for affixing to certain cases of gun-cotton false labels, to prevent the Great Eastern Railway Company from complying with bye-law No. 3, under the provisions of sections 37 and 39 of the Explosives Act, 1875, and for keeping a quantity of gun-cotton in an unauthorised place, again came on for hearing. Mr. Berry prosecuted on behalf of the London County Council, and Mr. J. P. Grain defended. On December 24th ult. the defendant company sent two cylinders, each containing 60 lb. of gun-cotton, to the Great Eastern Railway Company at Stowmarket as "E.C. powder." The prosecution alleged that the precautions adopted in the carriage of gun-cotton were entirely different from those taken in the conveyance of E.C. powder, which, on account of its harmless character, was treated as ordinary merchandise. The gun-cotton had, in consequence of the action of the Explosives Company, been taken to London without any special precaution. It remained at Liverpool-street on December 25th and 26th, and on the 27th was taken to Ford's house, which consisted of four rooms only, at Millwall. The police heard of what had happened, and communicated with the County Council on behalf of the company. Mr. Grain said he failed to find anything in the Act which required the affixing of a certain label. Had a true label been affixed the railway company would not have done anything more or anything less than they did do. Mr. Dickinson said the putting of the label "E.C. powder," instead of "gun-cotton," prevented the railway company from taking the special steps which would have been taken had it been known what the cylinders really contained. Mr. Grain, continuing, said that if an offence had been committed it had been done by the railway company, who were bound, as carriers, to adopt the same precautions when carrying E.C. powder as when carrying wet gun-cotton. It was incumbent on the railway company to adopt all precautions as prescribed by the Act. The defendants did not deceive the railway company that they were carrying an explosive. Had the County Council been rightly advised, they would have taken out a summons for a different offence altogether; and he submitted that on that count his clients could not be convicted. What the Explosives Company had done did not prevent the Great Eastern Railway Company from doing their duty. Mr. Berry argued that the wilful act of the defendant company caused the breach. All he relied on was the evidence, and he admitted there was a difficulty. Mr. Dickinson said he must hold that Mr. Grain was right, and he dismissed the first summons. Mr. Grain then dealt with the question of storing the gun-cotton in an unauthorised place, and argued that from the time it left Stowmarket until it was seized it was under conveyance. It was a mere temporary housing of the gun-cotton while it was in transit. On those grounds he held that this summons must also fail. Mr. Berry submitted that if the goods were not properly labelled the requirements of the regulations as to conveyance had not been complied with. The labels had not been marked with the name of the explosive. Mr. Dickinson said he had no doubt that there had been an infringement of the sub-section by the packages being labelled wrongly. Although there must be a conviction, he could not help thinking it was a very technical matter. The whole case hinged on the defendants not having properly labelled the packages, and for that they were clearly wrong, both legally and morally. Through that the whole trouble had arisen, but he must also remember the thing arose through great pressure. He could not believe the Explosives Company had acted as they did for the purpose of saving a few shillings, and another potent reason was that there had been no real danger to the public, who, however, had a great scare. There would be a penalty of £5 and £8. 8s. costs, but the gun-cotton would not be forfeited.

**GOLD PRODUCTION.**—The output from the Rand district during the past month, as cabled by the Witwatersrand Chamber of Mines, amounts to 143,195 oz. This total, however, is exclusive of the returns of several companies which, under the title of the "Association of Mines of the South African Republic," give their joint output as 33,510 oz. As the Wemmer result is included in both returns, we have deducted it from the Association figures, which are thus reduced to 27,913 oz. The month's production is, therefore, 171,108 oz., and shows a decrease of 2,844 oz. as compared with the previous total, and a decrease of 15,215 oz. as compared with the corresponding month of 1895.

## The Patent List.

*It is compiled from Official sources in the Manchester Laboratory, under the immediate supervision of Davis and Alfred R. Davis, who report professionally value of Chemical Patents.*

### NOTIFICATIONS FOR ENGLISH LETTERS PATENT.

### NOTES OF LATEST COMPLETE SPECIFICATIONS.

*Extracts are specially prepared for the Chemical Trade Journal, RIGHTS of publication are RESERVED. This is the earliest extracts of Chemical and allied patents accessible to the*

Process in the Method and Apparatus for Washing Alkali in, Obtained in Electrolytic Apparatus. P. Jensen, 77, Chancery-C. (communicated by H. C. F. Störmer, 5, Zettlitzgrade, Christiania, Eng. Pat. 24,837. Dec. 27, 1895.

Electrolytical apparatus employing a mercury cathode the amalgam of the alkali and mercury is generally decomposed

To facilitate this decomposition the following apparatus. A convenient receptacle containing a layer of amalgam and a supernatant layer of water is fitted with a shallow tray. This tray is moved up and down by a rod attached to the tray. When at the bottom the tray is charged with and on being raised the latter falls through the water in a fine decomposed. As an alternative lifting device a chain with cups attached may be substituted for the tray. There is one

Basket or Packing Case for Carboys of Acid and other C. Pottier, 14, Rue St. Ferdinand, Paris. Eng. Pat. 11,405. June 11,

Attention is a modification of the now familiar steel carboy. The upper and lower rings are made of wood, which can be to the desired shape after steaming, and are afterwards lined with tar, etc., to render them acid proof. These rings are supported by a suitable number of principal uprights rivetted to the wooden rings. At a convenient distance upper ring is a second band which strengthens the principal band, while carrying a number of intermediate uprights, convenient room for the top ring to be used as a handle. The principal features are the use of a wooden ring at the bottom under the hamper, thus obviating breakage when the carboys are above the other, and the addition of a spring support to of the hamper. At the centre point where the bottom overlap each other a coil of hoop steel is fastened, which, by elasticity, prevents the bottom of the carboy being broken, how much the bottom of the hamper may have sunk. Under these conditions, however, the bottom ring keeps the carboy off the ground here are two figures.

Improved Soap Extract and a Process for Manufacturing the A. Luhn, Rittershausen, Barmen, Germany. Eng. Pat. 7,442. 1895.

Process of a soap lye, hard soap must be reduced to small pieces, in troublesome and inconvenient. When dry-soaps or soap prepared, to overcome this difficulty, it frequently happens loss in cleansing power by the treatment. This invention to avoid the drying process by making a soap on the basis—180 parts of soda are dissolved in 300 parts of boiling water, his solution 200 parts of pure soap having a basis of turpentine resin are dissolved and 200 or 300 parts of dried and sifted

neutral soap. The soap thus obtained is shredded and mixed by continual agitation with pulverised neutral soap in the proportion of 100 parts of the former to 200 of the latter,  $\frac{3}{5}\%$  of caustic ammonia being simultaneously added. In this way a handy and cheap soap extract can be made.

Process of Rendering Amorphous Phosphorus Applicable as a Substitute for Yellow Phosphorus for Matches, Primings, and the Like. M. Bals, III., Wassergasse 4, Vienna, and E. Gurovits, I., Bartensteingasse 8, Vienna. Eng. Pat. 4,714. March 2, 1896.

Sulphur is melted, and amorphous phosphorus added, well mixed, and the heating continued for some time. The percentage of sulphur is varied according to the use the product is to be put to. When cool the product can be pulverised without danger.

## SOCIETY OF CHEMICAL INDUSTRY.

### MANCHESTER SECTION.

THE last meeting of the session was held at the rooms of the Chemical Club, Victoria Hotel, on Friday, the 8th inst., the object of the meeting being to discuss the papers read during the session and published in the Journal of the society up to the time of the meeting. The gathering was not quite so strong as usual, owing, no doubt, to the sudden burst of fine weather prejudicing members in favour of discussing natural science with nature itself instead of indirectly through the medium of the society.

In connection with Dr. Lewkowitsch's paper on the "Estimation of Unsaponifiable Matter," Mr. Bell indicated the method he usually adopted. Reference was made to the tariff of the insurance companies, and a short discussion on this point ensued. Dr. Lewkowitsch objected to Mr. Bell's method, because it was a differential one, and pointed out the discrepancies in the insurance companies' tariff, set forth in his recent paper on "Wool oils," read before the Society of Dyers and Colourists (an abstract of which will appear in an early issue of this Journal—Ed. C. T. J.). Mr. Thompson also took part in the discussion, and suggested that in Mr. Bell's method there was a danger of loss in washing. He also referred to the greater solubility of iron and lime soaps over soda soaps in petroleum spirit.

Dr. Gerland contributed a few further particulars about his method of estimating indigo, which was discussed by Dr. Schunck, Dr. Grossmann, and Mr. Barnes. Dr. Schunck pointed out how he had experienced a loss in estimating indigo, and referred to the researches he had made to ascertain how the loss occurred. Dr. Grossmann took exception to the method, because it was not founded on a commercial basis, a condition which he deemed essential if such a test was to be of service for practical purposes. He expressed his preference for small trials in the laboratory on the lines followed in the dyehouse. In replying to the discussion, Dr. Gerland pointed out that practical experience showed that small scale tests did not tally with the results obtained with large scale tests, and emphasised the difficulties arising from the variation in the shade and depth of colour when tests were made in this fashion. The discussion on the remaining papers was somewhat desultory, and cannot be summarised without encroaching upon the publication rights of the Society, in the Journal of which they will appear in due course.

### LIVERPOOL SECTION.

This section met at University College on Wednesday evening, the 6th inst., under the presidency of Mr. Eustace Carey. The Chairman took the opportunity of remarking that a statement had recently been published to the effect that the British alkali trade had of late years decreased to a considerable extent. The statement he criticised, pointing out that it was based on the money values of the products, which is altogether misleading by reason of the lowering of the prices of production in late years; by taking the actual weight production, the figures showed an improvement instead of the reverse. Dr. G. C. Clayton read a paper on "Chlorine as a disinfectant." He detailed a series of experiments, conducted on a bacteriological basis, with a view to ascertaining the efficiency of chlorine, of bleaching powder, and of sodium hypochlorite. The experiments, carried out in conjunction with Professor Boyce, of University College, gave results distinctly in favour of the use of sodium hypochlorite as a germicide. Comparisons favourable to sodium hypochlorite were made between this material and such products as corrosive sublimate and carbolic acid. A paper was also read by Mr. W. J. Orsman on colliery explosions in dusty mines, the results of communicated experiments tending to show that carbon monoxide when mixed with coal dust forms a highly dangerous and destructive explosive. The inference to be drawn from this is that such blasting agents as gunpowder, which produce carbon monoxide on burning, are highly dangerous in their application to coal mining. This meeting terminated the society's sittings for this session.

## Parliamentary Jottings.

### DEPRESSION IN THE COAL TRADE.

In the House of Commons recently Mr. D. Thomas asked the Home Secretary if he was aware that, owing to the protracted depression in the coal trade, a number of collieries in the Aberdare and Rhondda Valleys have been closed; that, in consequence, several thousand workmen have been thrown out of employment; and that during the past five years the wages of over 100,000 workmen engaged in colliery work in Glamorganshire and Monmouthshire have been reduced by nearly 50 per cent. on the standard rates; and whether, in view of the suffering and distress that prevails among the workmen in this great national industry, the Government is prepared to take immediate steps to relieve it, similar to those proposed to be taken to assist the owners of agricultural land.

Sir M. White Ridley: I am aware that certain collieries have been closed in this district because they cannot be worked with profit, and also that a great reduction of wages has taken place in the last five years. The hon. member, however, will remember that though wages have fallen from 57 per cent. above standard in 1891 to about 11 per cent. above standard at the present time, there was a corresponding rise in the five years previous to 1891, and that the present rates are higher than the rates in 1886. I find also that the number of persons employed in coal mines in the two counties has increased from year to year, and was greater in 1895 than in any previous year.

Mr. Thomas asked the right hon. gentleman if he was aware that the rates had gone up in that district during the last few years.

Sir M. White Ridley replied that he was not aware that the rates had risen during the last few years.

Mr. Fenwick: I beg to ask the President of the Local Government Board whether he is aware that great poverty and distress exists in the county of Northumberland in consequence of the continued depression in the coal trade, notwithstanding the fact that the miners' wages have been twice reduced within the last six months; and whether, in view of these facts, the Government will take steps to remedy such distress by means of a subvention or otherwise.

Mr. Chaplin: I was not aware of the distress referred to in the question until the hon. member was good enough to send me a newspaper extract in support of his statement. In that extract I find it stated that the collieries of Northumberland are, on the whole, well employed. I assume that the question has reference to the villages of Bebside and Chevington, where, it is stated, there has been much distress in consequence of the number of days the two collieries have been idle. I am glad, however, to find from the same source that assistance has been given by the Northumberland Miners' Association, and also in money and food by persons in the neighbouring districts. While I greatly regret there should be distress in these two villages, it is not in my power to take the course suggested.

### A SUGGESTED COMPTROLLER OF PATENTS.

In reply to Sir J. Leng (Dundee), who asked a question with reference to the suggestion of Lord Justice Kay that a comptroller of patents should be appointed to deal with prior specifications and applications for patents,

Mr. Ritchie (Croydon) said: I am not prepared to propose the alteration of the existing practice. The subject is a thorny one, and has engaged the attention of Parliament and of the public on and off for many years. 25,053 patents were applied for in 1895, and an enormous staff would be required if the obligation of deciding on the novelty of each application was imposed on the Patent Office. I must further remind the hon. member that the most eminent authorities differ occasionally as to whether an invention is new.

## MANGANESE IN EASTERN TENNESSEE.

BY WILLIAM MCGOVERN.

MANGANESE ore in considerable quantities occurs in Shady Valley in the eastern part of Johnson county, Tenn., and near the Virginia line. At what is known as the Heberlin mine an opening was made some years ago and about 800 tons of a superior quality of manganese taken out, which still remains piled near the mouth of the mine. When work was stopped the ore apparently continued in about the same quantity under the low ridge in which it was found. The amount was won in a space of 15 feet wide by 40 in length. About 100 yards from the main opening another was made, disclosing the ore in about the same quantity. Across a small stream on another but somewhat higher range of hills manganese has been found at several places, although not so plentifully as at the main opening from which the pile of stock ore was taken. The ore here is principally a psilomelane, while in the other openings in the valley it is pyrolusite.

Next to the Heberlin the most important showing of manganese in Shady Valley is at the Wright property farther up and near the head

of the valley. During the past summer, 1895, an opening was on the ore, and about 150 tons were taken out. The ore here massive form about six feet under ground and about the same of feet in thickness, and at a distance has somewhat the appearance of a seam of coal. When work on it was stopped the ore shows signs of exhaustion, and it probably exists at this place in considerable quantity. At about a mile from the Wright opening in the small stream a manganese ore was found, which upon investigation proved to be important, as it has been followed for several yards is here in the shape of a ledge with upturned edge, four feet wide six deep. About 10 tons of ore have been mined at this place. Lower end of the valley on lands of the estate of P. W. Sheaffer prospecting has been done and the ore exposed in several places. The several openings on this property some 15 or 20 tons of manganese have been raised.

As the distance from Shady Valley to railroad is 20 miles over roads the work so far done has been for the purpose of development to prove the existence of manganese ore in quantity. Aside from places before mentioned manganese has been noted at more than other localities in the valley, and it is believed that this section prove the most important manganese district along the entire valley of Virginia and Tennessee. The analyses of these are here given:—

### Analyses of Johnson County, Tenn., Manganese Ore.

|                                     | Silica. | Met. Iron. | Met. Man. | P. |
|-------------------------------------|---------|------------|-----------|----|
| Heberlin bank, pile of stock ore .. | 1'620   | 4'600      | 51'048    | 0' |
| Heberlin bank, pile of washed ore.  | 1'100   | 3'000      | 55'000    | 0' |
| Alex. Coles at small stream.....    | 1'400   | 2'300      | 53'085    | 0' |
| Wright bank .....                   | 7'600   | 7'100      | 41'440    | 0' |
| Sheaffer bank .....                 | 4'120   | 5'200      | 50'250    | 0' |
| King bank .....                     | 1'700   | 16'100     | 40'870    | 0' |

Outside of Johnson, manganese is known to be present in Clinch, Unicoi, Sevier, and Monroe counties on about the line which is the junction of the lowest Silurian with metamorphic and rocks of the azoic belt. In this connection a close study has developed certain which may be of interest both from an economic and scientific point.

1. The nearer manganese ore occurs to the line of the stratified lower Silurian rocks the more likely it is to be a psilomelane, changing gradually to the form of pyrolusite as it enters the azoic belt.

2. Where found in deposits of lower Silurian or Cambrian age more or less associated with iron ore, becoming more near manganese as its position in older rocks is encountered.

3. When an ore holds manganese and iron in the proportion about 40 and 15 per cent. metallic and low in silica, the percentage phosphorus will be low but increasing as these proportions are in either direction. Whether this is only a feature of the East Tennessee deposits or holds elsewhere is not known.—*American Manufacturer*

## EXPORTS OF PETROLEUM FROM U.S.A.

THE Chief of the Bureau of Statistics, Washington, gives the following returns of the exports of petroleum and petroleum products for March, 1896. The total shipments were 64,26 gallons, compared with 59,983,144 gallons in 1895. The total for nine months ending March, 1896, was 650,676,974 gallons against 671,190,133 gallons during the same period in 1895. Details of the shipments are as follow:—

|                          | CRUDE PETROLEUM.          | Gallons. |
|--------------------------|---------------------------|----------|
| Total, March, 1896 ..... | 8,510,998                 |          |
| " " 1895 .....           | 10,156,490                |          |
|                          | NAPHTHAS.                 |          |

THE MICHIGAN ALKALI CO.—This company's works at Wyandotte, Michigan. The president of the company, Capt. J. Ford, is the founder of the alkali trade on the Detroit River. The company produce an excellent high-grade soda ash, that has made itself very popular among users in the natural gas regions. Further extensions of the plant and output are under consideration.

### TYREE'S LITMUS PENCIL.

and in commerce litmus is a colouring matter prepared from various species of lichens by treating them with ammonia, ale urine, chalk and indigo. It contains four distinct colouring matters, viz., azolitmin, erythrolitmin, erythrolein, spaniolitmin. Erythrolitmin occurs rarely in litmus, and erythrolein is coloured purple and not blue by alkalis, azolitmin and erythrolitmin considered the essential colouring matters of litmus. It will be such a complex substance containing so many impurities in preparing what is known as litmus paper, which is unfit for use even when freshly prepared, as it will not keep, nor will it give the presence of acids and alkalis when they exist in portions, from the fact of its being impossible to prepare a litmus of sufficient strength to impart to paper litmus stand exposure and produce a correct impression upon acids. Though there may be a certain lack of impartiality in the latter indictment, it is, however, not wholly without foundation. The ingenious pencil contrivance we illustrate herewith

many advantages over ordinary litmus paper, being a very well as handy, source of litmus, since the pencils are retailed each, being placed on the market by Messrs. Thos. Christy 25, Lime-street, E.C. The pencil itself is constructed of pure blue and red litmus inserted in an ordinary wood and is an advantage both in utility and accuracy over litmus preparations hitherto in use. It is characterised by its simplicity, and Mr Tyree claims that it will detect one part in a thousand, whereas litmus paper can only detect one part in a hundred (1,400). For use, sharpen the ends as you would a lead pencil, mark on a strip of white paper and insert the specimen to be tested. Before using this the ends are dampened. A convenient method which we have arrived at in the trial of the pencil is to make a small red or blue spot, as may be, and place on the same a drop of distilled water of greater diameter. The liquid is then drawn slightly off the spot, a solution having been formed *in situ*. On adding a substance to be tested the reaction is clearly visible against the surface of the paper. In this way great accuracy is attainable following the speedier method of dropping a little of the substance to be tested on to the streak or spot made with the pencil, of a solution made from 1/10 c.c. of normal sulphuric acid in 100 c.c. of water is, we find, at once plainly indicated.

### BULK OIL INSTALLATION AT BOMBAY.

erection of oil storage tanks on the new Mody Bay Bunder, between the new Ballard Pier and Carnac Bunder, stretching over more than a thousand feet into the harbour, is now commencing the wholesale importation of kerosene oil by the Bulk Oil has now commenced. Recently the tank oil boat Bullmouth arrived in harbour, bringing over five thousand tons of oil. The tank steamer was brought to the Mody Bay where the oil pumped out into tanks by the engines belonging to it. The oil, says the *Bombay Gazette Budget*, will fill up two hundred tanks, the capacity of each being 698,120 gallons. Two pumps are provided in the steamer for pumping out the oil from the tanks. Each is capable of discharging from three hundred to four hundred tons per hour when working at full speed. The Bullmouth took about seven hours to fill up the shore tanks with 1,400,000 gallons of oil.

The construction of the oil tanks, which form a unique land in the harbour, a large area of land, measuring six hundred and twenty feet in length, and two hundred and ninety-seven in breadth, or about a thousand square yards, and surrounded on three sides by water, has been acquired by the Bulk Oil Syndicate from the Port Trust. The construction of these tanks was undertaken in November last, there being a strong prejudice against the storage of oil in Bombay, Messrs. Graham and Co., the Bombay agents of the syndicate, found great difficulty in getting a piece of land; and it was a considerable time elapsed that Mr. R. T. Campbell, of that firm, succeeded in convincing the Port Trust that a bulk oil installation was a thing. The local conditions in Bombay being different from those in presidential towns, it is no wonder that great difficulty was found in securing a safe and proper site. Once, when the installation was in its infancy, it was urged that there might be spontaneous combustion under the influence of tropical heat. A very simple

system of ventilation removes the risk of danger from explosive gas. There are four tanks, each being of 2,500 tons, or 698,120 gallons capacity. The tanks are sixty-four feet in diameter by thirty-five feet in height. On the eastern end of the reclamation a pier is constructed, alongside which the tank oil steamer was moored and discharged her cargo by means of a ten-inch main, branching off into two seven-inch delivery pipes, communicating first with a small settling tank, and then with the storage tanks. The tanks themselves are surrounded by an embankment nine feet six inches high, five feet thick at the base, and two feet at the top, so that, besides preventing the tanks from being tampered with, the very remote possibility of a tank bursting is provided for. In convenient proximity to the tanks, but, of course, outside the high embankment, a filling shed, one hundred and five feet long by sixty-five feet broad, is also erected, and is connected with the tank main by four-inch pipes. Adjoining the filling shed a tinning factory is constructed, a hundred and fifty feet long by forty-five broad, while a large storage godown is built at the eastern extremity of the company's land. The Port Trust are building a line of railway connecting the installation compound with the Great Indian Peninsula and

### IMPORTS AND EXPORTS FOR APRIL.

THOUGH the Board of Trade returns for last month show a much larger volume of trade than in the same month last year, still the items affecting the chemical trade do not show any material improvement. In the imports, chemicals, dyestuffs, and oils, are less in value, while the exports of alkali, salt, and chemical manures still show a declension in both quantities and values.

#### IMPORTS OF FOREIGN AND COLONIAL PRODUCE.

**DESTRUCTION OF A CANDLE FACTORY.**—The candle factory of MM. David Imbert and Cie., at Vaise, a suburb of Lyons, was completely destroyed by fire last week. The loss is estimated at several hundred thousand francs.

**EXTENSION OF THE FOYERS ALUMINIUM WORKS TO GREENOCK.**—The British Aluminium Company have arranged for the acquisition of certain water rights and the erection of a factory at Greenock, to be carried on in conjunction with the works at Foyers.

more than where it was not used." At Cavan, "where used, most satisfactory results followed." In Dungannon county Tyrone, the potato crop was exceptionally good, in quantity and quality; this is attributed to the favourable weather and the fact that the spraying of the potato crop "has become a practice in the neighbourhood." In Tobercurry district, "some farmers used the spraying machine with good results." In Mohill district, county Leitrim, "potatoes the uplands, where they were not injured by the frosts and protected by spraying materials (strawsonite)." These in eight or nine different counties, all indicate the Irish farmer to be on the alert, and it cannot be doubted that a more resort to the operation of spraying—of which there are arguments—must add substantially to the productive capacity of

evidence, allied to but distinct from the foregoing, is the report of the Council of the Royal Dublin Society which was issued. Last season a sum of £300. was voted by the Society for the encouragement of potato spraying, and a circular was issued by the Board of Guardians in Ireland. The result was that 202 farmers and over five tons of sulphate of copper were

At the close of the season 109 opinions as to the efficacy of the treatment were received from growers who had resorted to the use of the material. Of these 13 were "very favourable," 80 were "favourable," 15 were "doubtful," and only two as "unfavourable."

#### INSOLUBLE PHOSPHATE.

The importance of soluble phosphate is certainly in a measure over-estimated by most agriculturists, there is undoubtedly good reason to think that generally speaking they fail to sufficiently realise how important a constituent insoluble phosphate may be, consequently an attention to this ingredient will, we feel assured, say the *Express*, result in distinct advantage. A comparatively small amount of insoluble phosphate should easily comprehend that when dissolving mineral bones, and other substances for the production of manures, practically quite impossible to reduce them entirely to a solution, therefore these preparations must always contain portions of more or less altered raw materials which naturally soluble, that is to say, of course, they are not capable of dissolving in water; and manifestly we need hardly point out the inferior value in almost every respect possessed by phosphate soluble over the insoluble variety, so that at least under all circumstances it is advisable to retain only a relatively small amount in the latter condition. Whatever the source from which it is referring now to phosphatic ingredients employed in manure-dissolved fertilisers, the insoluble phosphate occurs as a known to chemists as tribasic or tricalcic phosphate; but in accordance to practical agriculture, the comparative value of any form of bone and that present as undecomposed mineral matter is different; indeed, insoluble phosphate, as we find it in mineral superphosphates, is very commonly considered of little value so far as the buyer is concerned.

Of complete disregard, however, is a course we can announce quite justifiable, because necessarily it must be of great slight use, particularly after the subjection to partial solution by sulphuric acid. To manufacturers the insoluble in such a matter of great moment, the value of these manures is determined solely by the quantity of soluble phosphate obtained; therefore, whatever is left undissolved represents so much waste. But when insoluble in suitable proportion occurs as bone otherwise satisfactory, it has a distinct and useful function in the prolonged action and more lasting attributes of dissolved bone compound, &c., is largely due to this constituent. Here, however, great attention to physical condition is dispensable; properly prepared samples should provide insoluble phosphate, consisting of bone in convenient size pieces, and modified by the decomposing effects of the acid used in the process for after undergoing that process the portion of this chemically dissolved nevertheless assumes a more friable character, its availability to plants being thereby materially increased also uniform distribution in the soil is ensured with greater facility. Consequently bone thus altered will evidently prove far more valuable as a fertilising medium to the same substance in its normal condition, for the practical value of manures is very much upon the properties it has acquired.

It is a mistake to mention that ingredients suitable for furnishing insoluble phosphate are the different varieties of bone meal prepared from either animal or mineral bones; also many phosphatic guanos answer the purpose; but bone ash imperfectly dissolved is hardly at all more available than mineral phosphate under similar conditions, and when present in rough, uneven fragments. Hence evidently very desirable to ascertain the source supplying this component of any manure we purchase, and farmers would be wise to

stipulate that the insoluble phosphate they require shall exist as bone. Clearly enough the percentage of insoluble phosphate in a fertiliser is regulated by the quantity of acid employed in manufacture, the quality of the raw materials dissolved, and a very influential factor, the degree of fineness attained in the preliminary grinding.

We feel constrained to specially remark that the bone dust utilised in making manures is even now, after so much experience has been gained, frequently decidedly too coarse to ensure adequate softening and thorough efficiency; and beyond all doubt the resulting product would be vastly improved by substituting, at least in part a much more finely divided meal. The reason given to account for the presence of these large pieces of bone is that farmers when buying like to see them, and unquestionably this is one cause of the defect; only often the fragments met with are of such dimensions as to remain undecomposed on the land for years, so obviously there is ample room for amendment, and yet to consult sufficiently the fancies and prejudices of purchasers.

At the same time agriculturists should perfectly understand that big masses of visible bone afford no true indication of a manure's excellence, for they may have been added subsequently to dissolving to mineral superphosphate, thus escaping the mixing with and action of the acid; or they perhaps consist of bone ash, which for an unpractised eye is difficult to distinguish from unburnt bone, but whose value when reduced to fine powder even is, as we have observed, much inferior to that commodity, while in either case pieces so rough can virtually render no service to crops, whether at present or in the reasonably near future; consequently, to apply material in this condition amounts literally to wasting valuable phosphate.

### Trade Notes.

**Obituary.**—The death recently took place of *Mr. James Hart*, F.C.S., of Embden-street, Hulme, a well-known microscopist, who held the office of honorary secretary of the Manchester Microscopical Society from 1890 to 1893, when he was elected a vice-president of the society. He was in his forty-ninth year.

**THE DURHAM COAL TRADE COMBINE.**—It appears that the parties to the amalgamation in the Durham coal trade are the Earl of Durham and Messrs. James Joicey and Co. The output of Lord Durham's collieries, 14 in number, is 12,000 tons per day. The purchase money is put down at from £800,000. to £1,000,000., and it is understood that the transfer will become an actual fact on June 1. Messrs. Joicey have at present under their control about 13 collieries employing 4,000 men, and the number employed in Lord Durham's pits is over 8,000, so that when the transfer is effected Messrs. Joicey, of which the leading partner is Sir James Joicey, M.P., will have control over nearly 30 collieries and 12,000 men. The Lambton fleet of steamers, which take in most of the coal won from Lord Durham's pits at Sunderland, are twenty in number.

**ANOTHER GIFT TO THE YORKSHIRE COLLEGE.**—The Court of the Clothworkers' Company of London, at a meeting held on Wednesday last week, resolved to grant a sum of £10,000. for extensions in connection with the textile industries and dyeing departments of the Yorkshire College, of which they are the founders and generous supporters. They have already expended £33,600. for the building and equipment of these branches of the college, their last gift being in 1892, when they voted £3,500. for new art rooms for the textile industries department. That department was established at the opening of the college in 1874, and the dyeing department was inaugurated in 1880. As the work of these branches has been extended and developed, the Clothworkers' Company have increased their annual subsidies, which now amount to £2,300. These liberal acts of the Clothworkers' Company are spontaneous on their part.

**ARISTOL.**—This product is extracted from tar by Messrs. Friederich Bayer and Co., for the treatment of burns. It is at once an anæsthetic, relieving pain immediately; an antiseptic, keeping the sore in a healthy condition; a stimulant, inducing cicatrisation, hastening the cure, and, unlike iodoform, it produces no injurious effect upon the patient. When the burn is felt, it should be bathed, and thereby disinfected, with a 2 per cent. solution of boric acid (not borax), puncturing with a fine needle all the visible blisters. Then apply with muslin an ointment composed of

Aristol 1 to 2 ounces  
Olive Oil 2 ounces } 1 ounce equals 28 grs.

dissolved and mixed with four ounces of vaseline, and four ounces of lanoline, worked up thoroughly with a spatula upon a smooth surface. This salve should always be kept at hand, as well as a boric acid solution, so as to be ready for immediate use. Around the muslin is placed a certain thickness of antiseptic cotton, then a sheet of rubber, the whole being enclosed in a bandage. The pain almost immediately disappears, and the cure follows quickly, even when the burn has been caused by chemicals.

**THE STABILITY OF STEEL GAS CYLINDERS.**—At the recent Conversazione of the Royal Society, among the various exhibits the mangled gas-bottles, the results of experiments on steel gas cylinders, exhibited by the Gas Cylinder Committee lately nominated at the request of the Home Office (*vide C.T.J.*, 459, p. 158), were of the utmost practical interest to lecturers using lime-light lanterns. They showed (1) the danger of using hard or unannealed steel for gas-cylinders; (2) the extraordinary amount of violent ill-treatment to which a good soft annealed cylinder may be subjected without destruction, even when charged to 120 atmospheres; (3) the effect of very great internal pressure steadily applied, in this case due to the expansion of liquefied ammonia gas which completely filled the cylinder when cold; (4) the violently destructive character of the explosion of mixed gases under pressure which no practicable cylinder can withstand.

**THE RESPONSIBILITIES OF MILK-SELLERS.**—In the Queen's Bench Division of the High Court, before the Lord Chief Justice and Mr. Justice Wills, an appeal was recently heard of Messrs. Spiers and Pond, Limited, against a conviction by a London police magistrate for selling milk which was deficient in cream to the extent of 17 per cent. A sanitary inspector had obtained a glass of milk at the Farringdon-street Station refreshment-rooms, kept by the appellants, and on analysis it was found to be deficient in cream to the extent named. The magistrate thereupon convicted Messrs. Spiers and Pond, imposing a fine of 40s., with £3. 3s. costs. This was the decision appealed against. It was alleged on behalf of the appellants that they had on the counter where the milk was supplied a notice to the effect that, though they purchased all milk sold by them under a warranty of its purity, they were unable to guarantee it as either new, pure, or with all its cream. The notice was held to be a sufficient "disclosure of alteration" within section 9 of the Food and Drugs Act. Their lordships were of opinion that the appellants had done all they could reasonably be expected to do to comply with the provisions of the Act, and quashed the conviction.

### FOREIGN REMITTANCES.

Owing to the inconvenience created by the various ways in which foreign subscriptions are remitted, we respectfully beg to inform subscribers that a *Crossed MONEY ORDER* is the most satisfactory method of remitting, both for them and ourselves. In the case of a Money Order, a letter advising us of same should always be sent, otherwise, owing to post-office formalities, much delay in tracing and acknowledging foreign remittances is inevitably entailed in this country.

## Market Reports.

### TAR AND AMMONIA PRODUCTS.

Benzols are firmer, the price for 90's now being 2s. 2d., and 50/90's 1s. 10d., prompt. Carbolic acids are rather firmer, there being a fair demand for 60% crude at 2s. 2d., while 40% crystals remain at 7d. There is no change in crude naphtha or solvent, the current quotations being identical with those of last week. Creosote and anthracene are quiet at recent prices. Pitch is easy at 32s. 6d., f.o.b. East Coast.

Sulphate of ammonia is quiet, and buyers are shy. Makers, however, are not pressing sulphate on the market. Values have receded somewhat, closing quotations being: London outside makes £8. 2s. 6d., Liverpool £8. 1s. 3d., Hull £8., and Leith £8. to £7. 18s. 9d., all prompt. The forward quotation for Beckton is £8. 10s. Nitrate of soda quiet.

### MISCELLANEOUS CHEMICAL MARKET.

Business in the alkali trade is not particularly brisk. For caustic soda values, however, remain stationary, as follows—f.o.b. Liverpool, 77%, £9. 7s. 6d. per ton; 74%, £8. 7s. 6d.; 70%, £7. 7s. 6d. per ton; 60%, £6. 7s. 6d., 10 ton lots and upwards. Ammonia alkali unchanged at £3. 7s. 6d. per ton, bags, f.o.r., and soda crystals quiet at 35s. per ton. Bicarbonate steady at £6. 12s. 6d., f.o.b. Leblanc soda ash steady at 1d. per degree, casks, f.o.r., and 1½d., f.o.b., for ordinary qualities. Saltcake in better demand at 22s. 6d. per ton, f.o.r. Lancashire. Bleaching powder £6. 15s. to £7. per ton f.o.r., and f.o.b. Lancashire for softwood casks, and £7. to £7. 5s., hardwoods, f.o.b. Sulphate of copper again higher at £19. for spot delivery. Recovered sulphur £3. 12s. 6d. per ton, f.o.r. Chlorate of potash 4½d. per lb.; soda 6d. per lb. For potash, caustic and carbonate, there is a continued good inquiry, and prices are well maintained. The position of brown acetate of lime is unchanged. In grey acetate here is more business being done. Acetates of lead and soda quiet,

and with a slightly easier tendency. Prussiate of potash 7d. per lb., according to make. Cyanide, 95/97%, 1s. 2d. per supplies of white powdered arsenic are still insufficient to meet demands, and price is £23. to £24. for spot delivery, and £23. Carbolic acid crystals quiet at 7d. per lb., in quantity. Cyanides there is only moderate business doing, and no change. Nitrate of soda slightly firmer at 8s. per cwt. Ammonia generally, keep steady in price. There are no general ideas as yet of any improvement in the demand for miscellaneous chemicals.

### REPORT ON MANURE MATERIAL.

The market remains without any special feature to note. Demand is fairly well maintained for early delivery, but supplies and any change in prices is rather in favour of buyers. Mineral phosphates are offered freely, and it is reported that South Carolina bone may be had under 6d. per unit—probably 5¼d.; 75/80% rock may be had under 6d. per unit, in cargoes, c.i.f. to ports, Summer-Autumn shipment. These exceptionally low prices only rendered possible by the exceptionally low freights now obtaining. For shipment 1897 some advance would have to be paid. Nothing to report in River Plate bones. Bombay bone meal may be had at £3. 12s. 6d., ex quay, on spot, and there are selling prices for shipment; but buyers' ideas, as the season is about to open, are about £3. 10s. There is nothing to report in crushed bones. Nitrate of soda is steady at 7s. 10½d. per cwt., quality, and 8s. for fine on spot. Due cargoes are worth 10½d. ordinary quality, and Autumn shipment 8s. 4½d. according to position. Home prepared dried blood is inquired for at 7s. 6d. per unit, f.o. rails at works.

### LIVERPOOL OIL AND COLOUR MARK.

**OILS.**—Palm oil is dull, and Lagos has been sold on £18. 10s., soft oils £17. 7s. 6d., and hard £17. There is a fair amount of business doing in olive, and the better grades are for prices ranging from £29. to £35. Linseed is quiet, makes being quoted 19s. 6d. to 20s. 6d. per cwt. in export. Cottonseed, though dull and lacking in activity, is steady whole, at 16s. 6d. to 17s. 3d. per cwt. Castor oil is quietly 2½d. for good seconds ex quay, and 2½d. to 2½d. for pressure French 2½d. to 2½d. per lb. spot. Tallow is depressed, prices unsettled; North American is quoted about 17s. 6d. to 18s. 6d., South 21s. 6d. to 22s., and Australian 19s. to 21s. per cwt. keeps firm, common being steady, at 4s. 9d. to 5s. per cwt. Turpentine are firm in price, there being a moderate demand; per cwt. Petroleum quiet; American 6¼d. to 7½d., and refined 5¼d. per gallon.

**COLOURS.**—Prices are steady, and practically without change. Ochres: Oxfordshire, common, £10., medium, £12., best, £14.; Derbyshire, common, 40s.; medium, 50s., best, 60s.; Wexford, 90s., seconds, 50s., and common, 18s.; Irish, Devonshire 45s.; French, J.C., 65s. Umber: 40s. to 45s. White lead Red lead unchanged. Venetian red, £6. to £10. Cobalt oxide, 9s. 9d.; black, 9s.; blue, 6s. Oxide of iron: £7.; medium, £10.; finest, £20. Zinc oxide, £22. 10s. to £24.

### THE METAL MARKETS.

**LONDON, WEDNESDAY.**—Pig iron, quiet: Scotch closed at 46s. 1½d.; Middlesbrough, 37s. 3d. cash, and 47s. 1½d. Copper, steady: Chili bars, G. O. B.'s and G. closed at £46. 3s. 9d. to £46. 8s. 9d. cash, and £46. 10s. to three months. Tin, steady: Straits closed at £59. 15s. to cash, and £60. 7s. 6d. to £60. 17s. 6d. three months; Austral English ingots, £63. 10s. to £64. Lead, quiet: Spanish, £11. English, £11. 2s. 6d. to £11. 5s.; Silesian spelter, ordinary, £11. Nickel, 1s. 2½d. Antimony, £30. 5s. Quicksilver: Fir £6. 15s.; second hands, £6. 14s. Copper shares, steady 2½d. to 2½d.; Copiapo, 2½d. to 2½d.; Libiola, 2½d. to 3; M Barry, 3 to 3½; Rio Tinto, 20½d. to 20½d.; Tharsis, 5½d. to 5½d.

**GLASGOW, WEDNESDAY.**—Market steady, with good Scotch done at 46s. 2d., 46s. 1d., and 46s. 1½d. cash. 46s. 4d. and 46s. 3½d. one month; closing with buyers at 4 cash, sellers ask 46s. 2d. Cleveland done at 37s. 5½d. and one month; closing with buyers at 37s. 3d. cash, sellers ask; Cumberland hematite done at 47s. 2d. cash, also at 47s. 4d. on closing with buyers at 47s. 1½d. cash, sellers ask 47. Middlesbrough hematite closes with buyers at 44s. 6d. cash ask 44s. 7½d.

## TYNE CHEMICAL REPORT.

TUESDAY.

als are in fair demand and rather more business is doing. nerals are unaltered. Soda crystals, £2. 2s. 6d. per ton, ght, locally. Caustic, 76/77%, £9. 5s. per ton; 70%, £7. 10s. 5s. per ton. Sulphur firm at £3. 17s. 6d. per ton. ing powder, softs, £7. 5s. per ton, nett; hards, £7. 10s. per ton, astic soda, 76/77%, £9. 5s. per ton, nett; do., 70%, £7. 15s. ett; recovered sulphur, 2 cwt. bags, £3. 17s. 6d. per ton, nett; 48%, £4. per ton, nett; do., 50%, £4. 3s. 4d. per ; do., 56%, £4. 6s. 8d. per ton, nett; alkali, 36%, £2. 15s. ett; white alkali, 48%, £4. 10s. per ton, nett; do., 50%, per ton, nett; do., 52%, £5. per ton, nett; hyposulphite of cwt. casks, £6. 5s. per ton, nett; do., 1 cwt. kegs, £7. ett; silicate of soda, 75° Tw., £2. 12s. 6d. per ton, nett; Tw., £3. per ton, nett; do., 140° Tw., £3. 7s. 6d. ett; soda crystals, casks, £2. 2s. 6d. per ton, ght; do., 2 cwt. bags, £2. 2s. 6d. per ton, nett weight; of potash, 5d. per lb., less 6%; pearl hardening, ton, nett; pure white sulphate of alumina, £3. 17s. 6d. ett; blanc fixe, £7. 5s. per ton, nett; chloride of barium, ystals, £6. 15s., per ton, nett; do., 90/95%, crude calcined, ton, nett; sulphide of barium, crystals, £4. 15s. per ton, nett; of alumina, £30. per ton, nett; aluminate of soda, £30. ett.

—South Durham salt is quoted at 9s. per ton, f.o.b. Tees, r business doing.

5.—The market continues quiet. There is now a full demand team coals, while for gas coals the consumption is rapidly . Coke is in fuller demand, both locally and for export. humbrian steam, 8s. 3d. to 8s. 6d. per ton; second qualities, 7s. 6d. per ton; small steam 3s. 9d. to 4s. per ton; house-, dull, 9s. 6d. to 10s. per ton; gas coals, 6s. 6d. to 6s. 9d. coke firm, 15s. to 16s. per ton.

## L PAINT, OIL, AND COLOUR REPORT.

TUESDAY.

—The trade is much quieter, with values little altered. The Imports into Hull up to date include the following:— 238,289 quarters; against 195,490 quarters a year ago. 31,696 quarters; against 55,854 quarters. Cottonseed, ns; against 80,034 tons. Olive oil, 9,785 casks; against s. Rape oil, 1,748 casks; against 4,238 casks. Oilcakes, ; against 5,907 tons. Tallow, 17,070 cwts.; against 4,899 nes, 3,624 tons; against 1,921 tons. Turpentine 6,221 against 4,300 barrels. Linseed oil, after advancing to 18s, the spot, closes easier at 17s. 10½d.; May-August and December is quoted at 18s. 3d.; boiled and refined, from . per ton extra. Export for the week has been 2,680 cwts. ston oil remains very flat, spot is 14s. 6d., naked; and there for May-August at 15s. Crude, 13s. 4½d., naked, spot; arrels 30s. per ton extra and casks £1. Export of refined oil ek has been 7,200 cwts. Castor oil, from 2½d. per lb. for re. Spirits of turpentine, 22s. Olive oil in better demand, s unchanged. Cod oil, £17. to £19. per ton. American soap, 70% fatty acids, £11. per ton in barrels. Margarine cools and kegs, 34s. to 84s. In Lard, owing to low prices, the ars to be buying largely for stock; American pails, 26s. 6d. ; firkins, 25s. 6d. to 26s. 6d. Locomotive grease, £10. per

—Linseed cakes are quiet, 95% pure, £5. 15s. to £5. Americans, £5.; Russians, £5. 12s. 6d. Oil cakes, £4. Cotton cakes in small request, but steady in price; best . 17s. 6d.; seconds, £3. 12s. 6d. Rape cakes unchanged. 3.—Makers, especially those who cater for a home trade, are the continued open weather stimulating business in these Prices are unaltered.

## WEST OF SCOTLAND CHEMICALS.

GLASGOW, TUESDAY.

ie middle of last week the feeling in sulphate of ammonia t the improved value was not to hold good, and quotations eded, though not quite back to the recent bottom price. procurable value is only round about £8. prompt, Leith, t two of the less hopeful holders willing to take £7. 18s. 9d. thing doing on the forward basis. Makers of mineral burn- t on important matter last week, and decided to lower the penny per gallon all round, to hold at least during the con- the off season. The price may be raised again before next assumption begins, but that will be as circumstances then raffin wax has been in unsatisfactory request, and the price

has given way a little. The market for general chemicals does not improve, and is indeed inclined to idling. Prices, though unchanged, are tending downwards.

Chief prices current are:—Soda crystals, £2. 2s. 6d., nett, Tyne; soda ash, 48/56°, £3. 15s. to £4. 15s. nett, Tyne; white alkali, 48/52°, £4. 10s. to £5. nett, Tyne; alum in lump, £5. to £5. 5s. nett, Glasgow; caustic soda, white, 74° £8. 7s. 6d., 70/72° £7. 7s. 6d., 60/62° £6. 7s. 6d., and cream 60/62° £6. 7s. 6d., all nett, Liverpool; bleaching powder, £7. nett, Tyne; saltcake, 23s.; borax, English, refined, £20., and boracic acid, £30. nett, Glasgow; bicarbonate of soda, 5-cwt. casks, £6. 10s., and 1-cwt. casks £6. 15s. nett, Liverpool; bichromate of potash, 4½d. nett, for Scotch and English deliveries (for export, 4½d. nett, f.o.b. Glasgow); bichromate of soda, 3¼d. nett, for Scotch and English deliveries (for export, 3½d. nett, f.o.b. Glasgow); chloride of potash, 5d. less 5%, Liverpool; nitrate of soda, 8s to 8s. 3d.; sulphate of ammonia, £7. 18s. 9d. to £8. prompt, f.o.b. Leith; salammniac, first and second white, £39. and £37. nett, any port; sulphate of copper, £18. 15s. less 5%, Liverpool; paraffin scale, hard, 1½d. to 1¾d., and soft, 1¾d. to 2d. per lb.; paraffin wax, 125° semi-refined, 2½d. to 2¾d. per lb.; paraffin spirit (naphtha), 7d. per gallon; paraffin oil (burning) No. 1, 6d., and crystal, 6¼d., at works, for Scotch buyers (English sales about ½d. lower); ditto (lubricating) 865° £5., 885° £5. 10s. to £6., and 890/895° £6. to £6. 10s. Week's imports of sugar at Greenock were 5,840 bags beet unrefined; 12,490 bags cane unrefined, and 2,366 baskets cane unrefined.

## New Companies.

**E. C. Cassels, Ltd.**—CAPITAL, £2,000., in £1. shares. This company has been formed to acquire and carry on the business of soap manufacturers, etc., and dealers in toilet requisites.

**Bailey Processes Co., Ltd.**—CAPITAL, £20,000., in £1. shares. This company has been formed to carry on the business of manufacturers and dealers in white lead, paints, colours, varnishes, etc. The subscribers to the memorandum of association are:—J. W. Douglas, 9, Arundel-street, Strand, chemist; J. T. Smith, 5, Arundel-street, Strand, accountant; W. A. Borwick, 5, Arundel-street, Strand, clerk; A. M. Waller, 5, Arundel-street, Strand, clerk; C. A. Hood, 8, Lacon-road, E. Dulwich, clerk; F. W. Robinson, 3, Grove-road, Brixton, civil servant; J. E. Barber, 45, Gateley-road, Brixton, clerk.

**Best Bros., Ltd.**—CAPITAL, £20,000., in £5. shares. This company has been formed to carry on the business of cement and gypsum manufacturers, quarriers, etc. The subscribers to the memorandum of association are:—T. J. Best, Kansas, U.S.A., cement manufacturer; W. H. Revis, 120, West Thirteenth-street, New York City, manufacturer; J. Best, Kirkby More, Westmoreland, quarry owner; W. C. Best, Shipley, Yorkshire, yarn agent; W. Dobson, Shipley, Yorkshire, leather merchant; W. Young, 11, Dale-street, Manchester, yarn merchant; H. E. P. Ackroyd, Old Bank Chambers, Bradford, solicitor.

**Kent, Good and Co. (Marsh Manure Works), Ltd.**—CAPITAL, £6,000., in £1. shares. This company has been formed to acquire the business of Kent, Good and Co., and to trade as artificial manure manufacturers, etc., at St. Philip's Marsh, Bristol. The subscribers to the memorandum of association are:—A. Grindell, Pile Marsh, St. George, Bristol, horse dealer; J. Davis, Eugene-street, Bristol, grease refiner; H. Jenkins, Ashley-road, Bristol, cab proprietor; W. T. Good, Dorset Villa, Brislington, Bristol, gentleman; T. Osborne, 52, Castle-street, Bristol, undertaker; W. H. Long, 34, Broad-street, Bristol, accountant; A. Kent, St. Philip's Marsh, Bristol, manufacturer.

**W. B. Dick and Co., Ltd.**—CAPITAL, £150,000., in shares of £10. each. This company has been formed to carry on the business of seed crushers, oil merchants, and refiners, paint and varnish manufacturers, and oilcake dealers, etc. The subscribers to the memorandum of association are:—C. E. Dick, Redstone, West Kirby, Cheshire, merchant; B. Dick, 207, Piccadilly, W., merchant; L. B. Page, 13, Waller-road, New Cross, secretary; C. R. Wise, 2, Luxmore-street, Brockley, salesman; W. H. Booth, 46, Mildmay Park, N., book-keeper; T. McSweeney, 13, Tudor-road, Upton Park, E., agent; G. D. Hand, 75, Godolphin-road, W., accountant.

**Colloid, Ltd.**—CAPITAL, £10,000., in £1. shares. This company has been formed to manufacture and deal in colloid and other chemical products. The subscribers to the memorandum of association are:—E. J. Mills, D.Sc. F.R.S., 5, Hillhead-square, Glasgow, Professor of Technical Chemistry; F. Hedderwick, Rockland, Helensburgh, paper-maker; A. Hughes, 121, W. George-street, Glasgow, chartered accountant; A. Foulis, 180, St. Vincent-street, Glasgow, solicitor; J. Mason, 59, Harriet-street, Pollokshaws, Glasgow, bookkeeper; P. W. Hendrie, 45, Bentinck-street, Glasgow, law clerk; A. C. Walker, 256, Renfrew-street, Glasgow, law clerk.
